MAR 3 1960 LAS Despriment of Astrophytics

CHRYSANTHEMUM MANUAL

TERMS

The base price for each variety is listed with the variety. What you actually pay for each Mum cutting depends upon the amount of "earned credit discount" that you establish by:

- 1. The number of weeks your order is placed in advance of requested shipping date.
- 2. The number of cuttings you order for shipment within a 52 week period.
- 3. The promptness with which you pay the invoice for mums—within 20 days.

Discounts Effective January 4, 1960

Early Order—Prompt Payment Discount

The number of weeks an order is recorded in advance of shipping date.

If Order Is Received	Discount Will Be
Less than 4 weeks prior to shipping	2%
4-5 weeks prior to shipping	5%
6-9 weeks prior to shipping.	6%
10-13 weeks prior to shipping	The late of the second
14-17 weeks prior to shipping	
18-21 weeks prior to shipping	9%

THE EARLY ORDER—PROMPT PAYMENT DISCOUNT IS AVAILABLE WHEN INVOICE IS PAID WITHIN 20 DAYS.

22 weeks or more prior to shipping...12%

Volume Discount

If you have ordered 10,000 or more cuttings during the 52 weeks prior to placing your order, the following firm discounts apply.

10,000	3%
30,000	5%
60,000	6%
700 000	7%
750 000	9%
210,000	
200 000	11%

Inquire about the discount schedule above these amounts.

TERMS OF SALE

Fifty rooted cuttings of each variety is the minimum that can be supplied. More than 50 of a variety must be in multiples of 50.

Any changes or cancellation of chrysanthemum orders must be received at least 30 days before shipping date. Every effort is being made to deliver stock which is free from pests, but purchases must be made with the understanding that we assume no responsibility for losses which may result from same.

To facilitate deliveries, cuttings will be shipped on Monday and Tuesday of each week. However, we will gladly make shipment on Friday or Saturday, if specifically requested and provided the order is received one month prior to the requested shipping date.

WARRANTY AND LIMITATION OF LIABILITY: Subject to the limitations of liability herein set forth, we warrant that the seeds, plants or bulbs sold are as described on the container, within recognized tolerances. Our liability on this warranty is limited in amount to the purchase price of the seeds, plants or bulbs. In no event shall we be liable for the crop, or for any loss due to the failure, impairment or quality thereof or varietal variance therein, whether such loss results from breach of the foregoing warranty, from breach of any other provision of the buyer's contract for purchases of said seeds, plants or bulbs, or from any other cause.

FAST DISBUDS AND FAST SPRAYS

Varieties suitable for this program include not only a number of popular standard types such as the Indianapolis group, but also numerous large flowered pompon, single, decoratives, and anemone types, which, when disbudded to one flower, result in three to four inch blooms, this being the size range that is generally sought for. Stem lengths generally range from 24 to 30 inches.

Why are They Becoming Popular?

First of all, they are distinctively beautiful and versatile in their use. The chrysanthemum, as is known in European floriculture, is devoted exclusively to these intermediate to large disbuds. It is thought that this method of culture partly resulted because the greatest percentage of flowers produced are purchased directly for home use. Thus, they can justifiably be called "Home-size-mums" with great future potential as we on the North American continent look forward to an expansion in our present home markets. The retail designer will use them to the same advantage as he does a carnation or a snapdragon because of their individuality in arrangement, but will favor the disbudded mum because of its rigid durability both in handling and in keeping qualities.

Efficient Croppers and Money Makers for the Producer

The schedule allows for approximately 3 and $\frac{1}{3}$ crops to be produced on a given bench area within a 52-week period which will produce a total of 36 to 40 individual flowers per sq. ft. As markets are both developed and educated to absorb these shorter stemmed disbuds, even greater efficiencies in reducing total crop time will be possible.

How are They Grown?

Spacing—Allowing a minimum of 12 sq. inches for each flowering stem during the higher light periods of the year ranging to a maximum of 15 to 18 sq. inches per stem during the lowest and poorest light periods, has been found to be sufficiently adequate to produce this crop.

Since this crop is to be pinched, the recommendation is to plant either $4'' \times 6''$ apart and prune each plant to two stems or plant $6'' \times 6''$ and prune each plant to three stems.

Optimum grade uniformity is generally achieved by permitting only two stems to remain on each plant. This procedure is specifically recommended when the large standard types of mums (Indianapolis, etc.) are to be grown in this fast schedule, whereas many of the intermediate type disbud varieties will readily support three stems per plant. Either method of handling will provide the same total production per given sq. ft. of bench area.

MARKET PACK OF FAST DISBUD

RECOMMENDED SPACING

Summer Flowering 6" x 4" Two stems per plant Spring & Fall 6" x 5" Two stems per plant Winter Flowering 6" x 6" Two stems per plant

Pruning—Selecting the two or three most uniformly vigorous shoots on each pinched plant and removing the remaining or extra breaks should be done at the earliest possible time. If growth is freely active, this pruning operation can be done 10 to 14 days after the pinch. Careless delay in the pruning operation will shorten the height of the crop below that which is normally possible with the given schedule.

Disbudding—Much like the pruning operation. In order to achieve maximum flower development and size, select the one flowering bud, usually the terminal bud, early, whenever the side buds are firm and can be rolled or snapped off easily.

Cultural Pointers—The principles of growing Fast Disbuds as related to soils, planting, fertilizing, temperature, watering, insect and disease control, are essentially the same as are recommended and required in the production of a regular scheduled crop of either pompons or standards.

BETTER CHRYSANTHEMUM CUTTINGS

Success in a year round flowering program starts and depends upon planting cuttings which are predictable in growth response, form and color. All cuttings are produced from "Mother Blocks" which originate from single-plant selections that were indexed for productiveness, resistance to, and freedom of disease.

The origin of this single-plant selection is the result of years of customer and propagator participation. This joint participation constantly provides the energy for further improvements on known varieties and provides direction for the propagator in his breeding program.

Constant indexing of mother blocks and their progeny assure you of a desirable and reliable base from which to plan production.

HANDLING CUTTINGS

All cuttings are packed in specially designed boxes that provide the best environment possible while in transit. All cuttings are rooted in a light medium designed to provide optimum aeration and moisture for the root system.

Cuttings are sufficiently rooted to plant directly into their final location. Some protection in the form of temporary shade or light syringing may be desirable for the first four to five days, but this should be discontinued as soon as plants are turgid and new root growth is observed. If at the end of 48 hours the plants are not turgid during the morning hours and new white growth is not visible then one of the following factors is restricting growth: Roots are not receiving sufficient oxygen, as a result of the soil being too tight or cuttings planted too deep; roots

are injured from fertilizer salts in soil as evidenced by browning or blackening of root tips; root system is not receiving sufficient water as a result of soil not being thoroughly watered prior to and after planting.

Since rooting and shipping tend to deplete the nitrogen in the cutting it is beneficial to water in the cuttings with a starter solution. Growers using a Fert-O-Ject may use the same solution as they use on older, established plants.

DELIVERIES

With the advent of the time pinch and precision method culture, it is necessary to have cuttings arrive on a definite date. To assure proper delivery, advance notice should be given the propagator. We would appreciate it if you could let us know your requirements early enough so that our propagator can plan his growing of stock plants and cuttings even more systematically.

DELAYS

With the reduced delivery schedule of the Railway Express Agency, there may be delays in delivering shipments. Chrysanthemum cuttings can be injured from cold as well as being too long in transit. If the cuttings are slightly wilted, they should be immersed in water for a short period and then planted. If the cuttings have been slightly frozen, place them in a cool room and thaw them out gradually. It is also possible to place them in a pail of cool water for a short period before planting. Of course, if stock is badly frozen, or if long delays have occurred so that the cuttings are heated, yellowed or rotted, a claim should be filed at once with the carrier. Air Freight and truck shipments have speeded up deliveries.

CULTURAL POINTERS

SOILS

The time taken and money spent in the cost of proper soil preparation should be considered the same as taking out an insurance policy on the success of your crop. Year-round growing has progressed to a degree of precision that will not permit the grower to have crop failures due to factors he can control.

Maintain an open, well-aerated soil that drains well in addition to having some moisture-retention capacity. Periodic additions of organic matter to greenhouse soils has become a necessary practice for maintaining these desired properties that are associated with good soil management.

In order to achieve uniformity in soil it is necessary to add uniformly responding material. Of the

CULTURAL POINTERS

various sources of organic material available German peat has been the most reliable form of soil additive. This is the result of the availability of a uniform grade, the slow rate of breakdown and the high degree of moisture retention it promotes in the soil. Other forms of organic matter can be used just as successfully but usually they require more study and effort to achieve the same results.

Caution should be exercised in the use of peat in soils that are naturally high in moisture retention. In cases where natural high soil moisture results in improper aeration, an inorganic additive such as perlite will be more effective in improving soil aggregation.

Greater care in soil preparation permits rapid penetration of water and a uniform supply of fertilizer. If water remains on the surface of your soil for more than a few moments after watering, the soil is not of good, open structure.

During the winter period, chrysanthemum plants are much more sensitive to overwatering and high soluble salts than during spring, summer and fall. When sterilization is arranged to just precede the planting for the winter crops, the results are best.

CHEMICAL STERILIZATION

Where steam is not available any of the following chemicals may be used to do a comparable job:

Methyl Bromide: Commonly called MC-2 is a combination of **Methyl Bromide** with 2% chloropicrin (tear gas) to act as a warning agent. It will give good control of nematodes, weed seeds and certain fungi. Methyl bromide is not an effective control for verticillium wilt.

Larvacide-chloropicrin: Commonly called tear gas, it is effective on fungi, nematodes, weed seeds and soil insects. Apply with a special applicator by plunging approximately $1\frac{1}{2}$ to 3 cc. per square foot of area.

Vapam: A relatively new material that has been effective in the control of nematodes, soil fungi and weeds. Higher rates will give complete control while lower rates will control weeds.

Mylone: A new material that is applied in a pellet or liquid form and does not require rototilling. This material shows promise on outdoor crops.

Various combinations of the above materials are available such as **DOWFUME**, **PICFUME**, etc. All of these materials are toxic to man and growing plants, therefore, caution in their use is necessary. After applying these materials the soil must be covered for best results and a period of aeration prior to planting is a must to prevent injury or death of plants. Low soil temperature is many times the factor that prevents use of these materials.

Comparative cost between chemical and steam methods show no cost advantage of chemicals and if danger of material and delay in planting is considered, steam is usually more economical. An exception is in large field operations, where soil temperatures are normally above 60° F, and the area may be prepared well in advance of planting.

SOIL MANAGEMENT AND STERILIZING PRACTICES

- 1. Apply and rototill all organic matter into soil prior to sterilizing to assure thorough wetting of material and the control of disease.
- 2. Make certain soil is loose and moist enough to permit steam or gas circulation, especially on ends and sides of bench.
- 3. Steam sterilize the soil so that the coolest point is at least 180 degrees F. for 30 minutes. Wherever possible sterilize before each crop. If one or two sterilizations a year are being practiced it is wise to space them into the cooler months of the year and receive the growth benefits of a warmed soil.
- 4. Experience has shown that planting immediately after the soil cools is safe and in most cases will give the best growth response. Delay in planting for one to two weeks can often result in an accumulation of salts. A liberal application of calcium sulfate (gypsum), 5 pounds per 100 square feet after steam sterilization will prevent injury to young roots. High phosphorous also reduces toxicity after sterilization.
- 5. When Rhizoctonia is a problem water the plants in, or within one day after planting with a solution of 1 to $1\frac{1}{2}$ pounds of **TERRACLOR** (75% wettable powder) per 1000 square feet. It should be noted that **TERRACLOR** will not eradicate rhizoctonia but inhibits its ability to infect, therefore it is important to treat as early as possible. This treatment does not mean that the disease cannot re-enter at some later date. Many growers are treating only those varieties which are susceptible to rhizoctonia.
- 6. Apply sufficient water to new plants to set soil firmly around the base of the roots and establish proper water movement within the soil.
- 7. Maintain the following Spurway nutrient levels:

Nitrate Nitrogen 10-25 p.p.m.
Phosphorus 5-10 p.p.m.
Potassium 20-40 p.p.m.
Calcium 200-250 p.p.m.

pH 6.0-7.0

Solubridge reading (1:5 dilution) 40 or lower.

STEAM STERILIZATION

The actual job of steam sterilization is relatively simple, but it is the small steps leading up to the job done that can complicate matters.

Two weeks prior to removing the old crop start to leach the bench. All soluble salts can generally be removed with two or three good heavy waterings. It is much easier to do this when the old crop is still in the bench as it pulls the moisture from the soil. If excess soluble salts are not leached before steaming, serious trouble can result because steaming often releases chemicals that were not available prior to steaming.

The bench should be properly rototilled and the desired amount of organic matter added along with the necessary fertilizers **before** steam sterilization. Amounts of the various chemicals to add are:

(1) Treble Superphosphate

5 lbs. per 100 sq. ft.

(2) Calcium Carbonate
(Ground Limestone

10 lbs. per 100 sq. ft.

(Ground Limestone) or Gypsum

10 lbs. per 100 sq. ft.

The bench should not be reworked after steaming because of the possibility of recontaminating the sterile soil.

The soil moisture level just prior to steaming is very important and is a point that is very sadly abused. Dry soil will not conduct heat efficiently and wet soil tends to condense excessive moisture. The soil should be in the same condition that is considered desirable in which to plant. This is called "friable" and means that after forming a soil ball in the hand that it can be crumbled with two fingers.

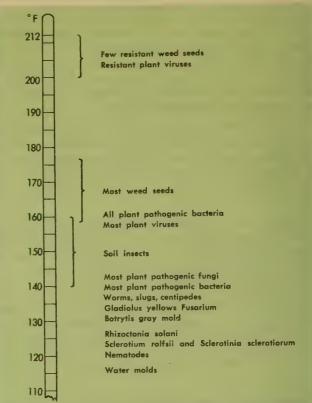

Moisture content of soil is important because of these reasons:

- (1) Heat combined with moisture does a better job of killing micro-organisms and weed seeds.
- (2) It takes less time to heat a moist bench than it does a dry bench. This is also the case with an exceedingly wet bed, where soggy benches almost take twice the time.

Large clods of soil should be broken so that the heat can penetrate to all areas uniformly.

Steam can be efficiently distributed to all sections of the bench simultaneously by the use of aluminum tubing 3" in diameter (with holes drilled in). Canvas hose with eyelets also works well. With both materials, two runs are recommended per 4-foot bench.

The soil should be held at the coolest spot to 180 degrees F. for 30 minutes, or when it first hits 200

Reprinted from California Agric. Exp. Sta. Bulletin No. 23. These various temperatures need to be maintained for 30 minutes to control the organisms listed. Concentrate on positive temperatures derived from using an accurate thermometer.

degrees F. Be sure to use an accurate soil thermometer every time and **do not guess**. The steam cover should be removed as soon as the desired temperature is reached so that the excess steam can escape into the atmosphere without condensing in the soil. As soon as the soil is cool enough to handle, it is time to start planting.

Steam, in forcing its way down through the soil, creates millions of tiny pores which will remain for the life of the crop if undisturbed. It is therefore strongly recommended that soil not be rototilled or worked over again prior to planting. This will not only save labor, but will greatly reduce any chance of recontamination.

When steam sterilizing, some growers use a plastic cover (not polyethylene) about 16 feet wide so that it can be extended to cover the aisles. This surface-steams the benches and bench supports. Instead of injecting steam into the end of the bench where there is danger of not reaching required temperature at the point of injection, it is suggested that the steam pipe be entered on the side about 8 to 10 feet from the end of the bench. A "T" is used whereby a ¾-inch pipe directs the steam to the short end and the long end is equipped with a 2-inch pipe. By this means there is even distribution.

Gloeckner CHRYSANTHEMUM MANUAL

FERTILIZERS

Feeding

Chrysanthemums do much better right from the start if the soil is not too rich. Very often this crop will start off faster in new soil as compared to old soil that has been sterilized just because of the lower nutrient level in new soil. When using new soil, apply 5 pounds of superphosphate per 100 square feet of area, plus a liberal application of manure before planting. Phosphorus moves slowly within the soil mixture. It should always be added before the crop is benched so that it may be mixed thoroughly into the soil. Liquid feeding with water-soluble fertilizers is fast becoming the popular method of applying fertilizer. Water soluble fertilizers are available in many different analyses and therefore you can apply the fertilizer your soil requires. Many growers are feeding soluble fertilizers through their automatic watering systems. Remember to apply weaker solutions of fertilizer more frequently rather than heavy doses less frequently. When using complete fertilizers in dry form we usually figure on using two applications at 2 pounds per 100 square feet of area starting shortly after the plants have started to grow and ending when the buds are visible. Remember that the plant is the best guide to fertilizer requirements and that more mums are ruined by overfeeding than by nutrient deficiencies.

Levels of Nutrition

When using sterilized soil, the best recommendations to follow would be to analyze your soil from time to time. We have found that when the following Spurway nutrient levels are kept, good crops are the result. Nitrate nitrogen should be 10-25 p.p.m.; phosphorus 5-10 p.p.m.; potassium 20-40 p.p.m. and calcium 200 to 250 p.p.m. To increase the nitrate level, feed one pound of ammonium sulfate per 100 square feet of area, and to bring up the potassium, apply muriate of potash not to exceed 1 pound per 100 square feet. If phosphorus is needed, apply monocalcium phosphate at the rate of 1 pound per 100 square feet.

In the cooler weather and shorter days of September, omit the nitrogen if the plants are growing freely. The mum assimilates more phosphorus and potassium during the time of bud initiation. Therefore, it is desirable to apply a complete fertilizer shortly after the buds are visible.

Soluble Salts

Soluble salts are chemical compounds consisting of an acid part (ion) and a basic part (ion). For example, common table salt, sodium chloride, consists

of one ion of chloride and one of sodium. Chloride is an acid-forming ion, and sodium a basic or alkaliforming ion. The two combine in chemically equivalent quantities to form a neutral salt. Other common acidic ions are sulfate, nitrate, bicarbonate and phosphate. Other common basic ions are calcium, magnesium, potassium and ammonium. Any basic ion may combine with any acidic ion giving rise to a great variety of salts.

All plant nutrients which are absorbed by plants from the soil or from culture solutions are absorbed in the form of salts or their constituent ions. All organic materials become "mineralized" through decay processes, and the nutrients in them are converted into salts before being absorbed by plants. Some salts contain plant nutrients and are beneficial in the small quantities required for plant growth. Others contain no nutrients. All salts are harmful beyond the small quantity required for plant growth. A little is bad, more is worse, up to the point where plants will be killed. Salts are found in most water and are applied as fertilizer. Improper watering may permit a concentration into the harmful range. Instruments called Wheatstone's bridges are available which measure total soluble salts in terms of electrical conductivity or conductance. Many laboratories of the Agricultural Extension Service are equipped with Solubridge instruments for use in assisting with soluble sait problems.

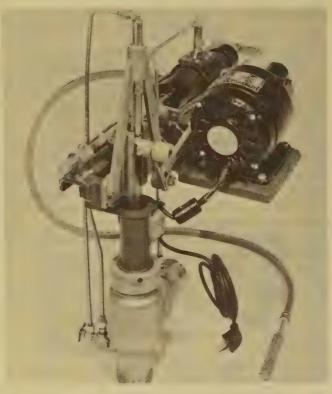

It has been found that when planting rooted cuttings, the Solubridge readings should not be higher than 40, while established plants do not withstand readings of 100 without showing some harmful effects. To remedy excess soluble salts, apply 2 to 3 gallons of water per square foot and leach out this high salt content.

FERTILITY CONTROL

MODEL E (Above)\$475.00 MODEL E-500535.00

CAPACITY

Standard Sleeve 5 to 120 g.p.m. (Ratio 200:1) Low Flow Sleeve 2 to 60 g.p.m. (Ratio 100.1)

- Can be installed in water mains from 1¼ inch to 4 inch
- Permanent type installation—electric motor driven
- Fully automatic
- Recommended for ranges over 15,000 square feet.

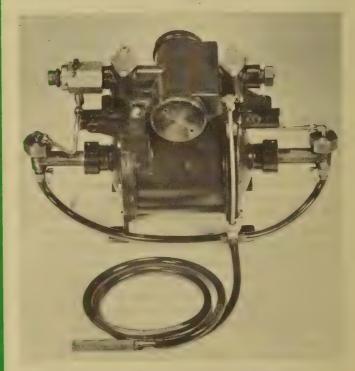

Injection of small quantities of balanced fertilizer into existing water lines is now the most efficient way to produce top quality. This can be done most economically with FERT-O-JECT. Chrysanthemums, both pot plants and cut flowers, respond equally as well under this system. The theory behind this recommendation is that plants require fertilizer in direct proportion to the amount of water they consume. The more rapidly a plant is growing the greater the amount of water it receives and consequently the more fertilizer is applied. It is possible to feed diversified crops with the same fertilizer.

Kinds and rates of fertilizer used will vary with the region and type of soil, but the following can be used as a general guide where constant fertilization is practised.

KIND OF FERTILIZER	50	TE-	-POUNI LLONS	DS PER (200:1)
Peters 25-10-10		35	to 50	lbs.
Peters 20-20-20		50	lbs.	
Peters 20-5-30		50	lbs.	
Ammonium nitrate) Muriate of Potash ⟨	{	25 15	to 35 lbs.	lbs.

The advantages of fertilizing with a FERT-O-JECT are:

- 1. Eliminates the labor spent on hand fertilization.
- 2. Maintains more uniform nutrient levels with no burning or starvation.
- 3. Automatically applies proper quantity of fertilizer.
- 4. Inexperienced help can apply fertilizer with no fear of burning plants because of dry soil.
- 5. Applies fertilizer the way plants use it . . . a little bit all the time.

CULTURAL POINTERS

Gloeckner CHRYSANTHEMUM MANUAL

PLANTING

PLANTING DATE

The proper planting date will vary according to the period of the year you desire to flower and the time permitted for growth of the plant prior to pinch.

Cuttings may be planted and allowed to flower without pinching. This is often used to improve quality. It also permits more crops a year from the same growing area.

PLANTING ROOTED CUTTINGS

When shipped all cuttings are active enough in growth and sufficiently rooted to permit planting directly into permanent locations. This method is recognized as being the most practical since it eliminates the check in growth commonly associated with transplanting. Never plant cuttings any deeper than they were in the propagating medium.

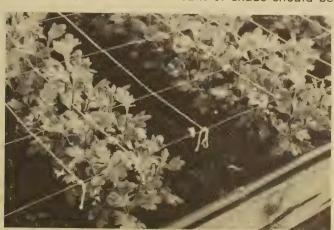

When planting from pots raise the soil ball ½ inch to ¾ inch above the soil line in order to keep the top of the ball exposed and dry. Regardless of preplanting chemical treatments, deep planting still invites infection by Rhizoctonia and Pythium. Pot up extra cuttings and plunge them in the bench as replacements for any losses occurring at a later date.

SINGLE-STEM OR NO-PINCH METHOD

Cuttings are planted and allowed to grow without pinching. It is an essential practice if the maximum number of crops a year are to be realized. Where crops are planted from September 15 to February 1, no-pinch method produces a superior crop, whereas a pinched crop can be weaker and of poorer quality.

LIGHT INTENSITY

Newly planted cuttings should have some protection in the form of a temporary shade and several light syringings for the first five to seven days. It is questionable whether it is necessary to shade cuttings in air cooled greenhouses. After plants are established, a minimum amount of shade should be

"HI-LITE" SPACING
IS NEWEST PLANTING
TECHNIQUE

used,—never reduce natural sunlight over 36 percent for satisfactory growth. Further light reductions will necessitate an adjustment in spacing to produce a satisfactory crop. Research work has shown that chrysanthemum production is directly related to light intensity. In other words, the greater the light intensity, baring heat effects, the greater the production. This makes clean glass a must in the winter months.

For cloth houses, the amber Saran is superior to the green because of more light under the amber covering. Naturally the plants require more water when grown under higher light intensities.

Shade is recommended when flowers are about one-half open to prevent them from sun-burning. When growing standards, a good practice would be to stretch muslin directly over the open blooms. This not only prevents sunburning but also keeps the blooms free from dirt.

DISTANCE OF PLANTING

For good quality chrysanthemums, we prefer to plant 7 x 7 inches or 8 x 8 inches pinched once, and thin the shoots to 3 per plant. On vigorously growing varieties the outside rows will support one more stem than the center rows in the bed. Light intensity should be high at the base of the plant for quality blooms, and if planted too closely, we have lost the factor which promotes quality.

For a single stem, no-pinch method pompons should be spaced 4×6 inches and standards 5×6 inches. When further spacing is used the sprays become too large. Fast disbuds (mini-mums) should be spaced 4×6 inches in the summer flowering period and 6×6 inches in the winter.

PLANTING DISTANCE FOR NO-PINCH METHOD

Pompons 4 x 6 inches Standards 5 x 6 inches

Fast Disbuds 4 x 6 inches (Summer) Fast Disbuds 6 x 6 inches (Winter)

TRADITIONAL SPACING
WITH BAMBOO CROSS TIES

CULTURAL POINTERS

PINCHING

Pinching in modern day chrysanthemum culture serves three functions:

- (1) To produce lateral stems which can be flowered thereby reducing plant cost and enhancing uniformity in the crop.
- (2) To determine the type of spray formation developed on pompons and singles.
- (3) To determine the type of bud formation (crown or terminal), subsequent type and fullness of the flower, and the amount of necking of flower stem on standards. Many factors affect the formation and development of buds on a chrysanthemum plant, one of which is the length of time a stem has grown. Experiments and field observations have shown that plants pinched too early produce early crown buds and the laterals developing as a result of this crown are usually long and uneven in flowering response. When plants are pinched too long after planting the lateral stem length is very short and the flower heads tend to be crowded together making an undesirable spray formation.

The schedules outlined in this book are designed to produce a crown bud which is surrounded by short branched laterals that are in proportion to the over-all stem length and will flower uniformly.

Regardless of the time period between plant and pinch all pinches must be made into the soft growth. Soft growth is most easily defined as growth that has occurred since planting that can easily be broken with a light twist of the thumb and fore-finger. Failure to pinch soft can often result in low shoot count and retarded development of shoots. The result is often an uneven crop with poor production. Pinching into hard wood often disturbs the root system of the

REMOVE TOP 1/2 INCH OF STEM WITH SHARP KNIFE

MAKE SURE ENTIRE STEM IS CUT WHEN PINCHING SOFT

plant because of the force required to cut the pinch from the plant. Improper pinching can easily reduce the production potential.

PRUNING

If all the shoots that arise from a properly pinched plant were permitted to flower there would be little uniformity within the flowering stems, and many of the stems would not have satisfactory substance or strength to be of any value. In order to gain consistency in stems on pompons no more than 3 stems per plant should be permitted to develop on the inside rows of the bed and four stems per plant on the outside rows. If fewer stems per plant are desired the spacing may be decreased slightly but an average of 17 to 20 square inches per stem has been found most satisfactory.

Standards are usually grown two stems per plant with three on the outside rows. The most common error in pruning is waiting too long after pinching before selecting the correct number of stems. A decided check in growth results from delaying the pruning operation. Pruning late when shoots are hard and woody only serves to remove accumulated energy that could have been used to good advantage on the flowering stems. In addition, it usually leaves scar tissue which does not heal properly and may serve as a port of entry for disease organisms. The practice of stripping all leaves below the pinch level at the time of pruning is questionable. First, it removes potential food manufacturing organs, and secondly, it opens up avenues for disease entry. If leaf-stripping is practiced, then remove only those leaves that show signs of disease or yellowing at the time of pruning.

CULTURAL POINTERS

DISSPRAYING AND DISBUDDING

Disspraying: Vigorous growing, large-flowering varieties often produce side shoots below the main spray after bud set which should be removed to promote the best development and timing of the flowering shoot. These side shoots develop most heavily during the high light intensity periods of growing and in greater abundance on the outside rows of the bench. It has been found beneficial to remove these shoots on crops which are flowered under black cloth.

Removal of the center bud of the spray on many varieties of pompons will often assist in developing a more open spray. It also improves the keeping quality of the spray since the terminal flower is always older, more open, and deteriorates more rapidly than other flowers on the spray. Timing the removal of this center bud for maximum results is as important as the timing of the disbudding on standards. Certain varieties during good growing conditions will initiate more buds than can develop into acceptable flowers. Removing part of the buds will improve the spray, timing, and increase the flower size on the remaining buds. On most varieties thinning to 4 or 5 buds per spray will produce higher quality.

Disbudding: Varieties grown as standards or disbuds are grown so as to leave only one bud per stem. This is called "taking the bud". If you are growing according to the plant, pinch schedule given in the manual you will be able to take the first bud that appears. This is called a terminal bud.

Terminal Buds: Terminal buds can be identified by the following traits: (1) A small, hard, central bud surrounded by a tight cluster of smaller buds all appearing similar and on a plane slightly below the center bud. (2) Normal-shaped leaf development up to the point of budding. (3) Terminal buds appear only after continuous short-day treatment as indicated by either shading or lighting period.

READY FOR DISBUDDING

Crown Buds: Crown buds are characterized by the following: (1) A somewhat softer and usually larger bud, surrounded by vegetative shoots having only leaf buds. Vegetative shoots are on a plane above the central bud. (2) Leaf shape may appear abnormal next to the central bud, being usually narrower and somewhat strap-shaped. (3) Crown may appear on plants at any time but will occur most often on natural flowering crops from October to December.

TERMINAL BUD SURROUNDED BY SIDE BUDS

The fact that crown-budding can occur at any time is an important clue to its origin and the condition responsible for its occurrence. It requires fewer number of days of correct day length to set the bud than it does to develop the same bud, therefore a crown bud only appears when the period was correct for **setting** the bud, but the environment was not correct for **developing** the bud.

Some actual cases where this might occur are: (1) Black clothing is not done consistently; too many nights skipped or poor-quality black cloth permitting too much light to fall on plants. (2) Lighting interruption caused by clock failure, or light leaking from an outside source interrupting the dark period. (3) Artificial light intensity inadequate outside or slightly shaded rows not receiving proper light intensity. (4) Failure to follow schedule and the growth from the pinch prior to lights out or black cloth shading was over twenty-four inches in length. (This is more likely to occur during the more rapid growing seasons of the fall and spring.)

In natural flowering of standards the following rule will assist in determining what to do with crown bud formation.

Oct. 3 to Nov. 15 Nov. 5 to Nov. 30 Dec. 1 to Dec. 15 REMOVE CROWNS THAT APPEAR BEFORE Sept. 5 Sept. 26 Oct. 3

Make the selection as early as possible to prevent the dog-leg appearance of the stem that develops from late selection on hardened stems.

Final selection or disbudding timing is an important practice often overlooked. Selecting the bud too early, may cause injury if not done carefully. The most common error is late disbudding. This can appreciably reduce flower size, color intensity and could delay flowering by as many as 4 or 5 days.

CULTURAL POINTERS

PREMATURE BUDDING

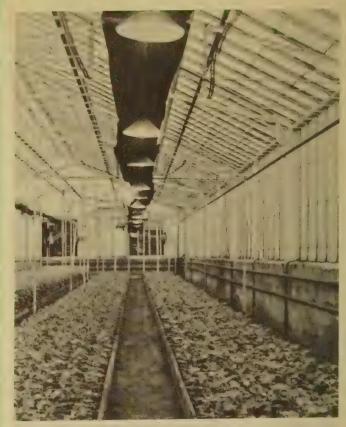

Bud initiation can occur anytime during the spring months-whenever temperatures in the greenhouses are consistently 60 degrees F. or above, and the days are short enough to initiate buds. These conditions can occur anytime up until May 1 depending upon the variety and the locality in which they are grown. Some varieties, such as the garden varieties and 8 and 9-week varieties, require very little short-day treatment, coupled with high temperatures, to initiate buds. This same tendency to set bud readily is what makes these varieties desirable for early shading and garden work. In order to prevent this premature setting of buds, these same varieties should be placed where they can be given additional light during the early spring months. Use 60-watt bulbs spaced 4 feet apart and 24 inches above the plants. Three hours of light during the middle of the dark period will prevent budding completely if the minimum intensity is 8 foot-candles. The same treatment on either end of the night might not be so effective during cloudy periods which create a shorter day.

BLINDNESS

Temperature is associated with blindness. When plants are grown below 50 to 55 degrees F. during the bud initiation period many varieties will produce blind growth. In "Year-Round Flowering" we have found that chrysanthemums should be grown in a 60-degree temperature to insure good bud development. Although there are some varieties which require a higher temperature, and there are other varieties that will initiate buds at a lower temperature, it is safe to recommend a 60-degree temperature in most cases.

In the case of a short-duration low temperature emergency the question always arises as to when does most damage occur? Experience with cloth house operations has shown that the most critical time in regard to loss of production is in plants that have been under a lights-out condition for three to four weeks. At this stage of growth failure to give

A two bed unit enables one person to handle black cloth.
Lighted units can also be shaded in a flowering house.

adequate protection can make the difference between critical injury to the bud resulting in complete blindness, and malformation of flowers or the development of nearly-perfect flowers. Stages of growth after this will be affected but not so often to the degree stated above. In conjunction with the above statement it should be noted that extreme fluctuations in night temperature above 65 degrees F. and below 54 degrees F. on winter crops after the bud is visible can cause serious delays and malformation of the bud. For best results, when finishing plants cool do not lower the temperature in more than 2-degree intervals over a 5 to 7-day period.

SHADING (BLACK CLOTH)

From March 15 to Sept. 15 it is necessary to shorten day length with black sateen cloth. Light intensity under cloth should be no more than two foot-candles to prevent delayed and uneven flowering. Shade should be applied as late in the evening as possible to prevent under-cloth temperatures over 90 degrees F. Temperatures of 90 degrees F. and above will delay flowering as readily as failure to apply black cloth. Applying the cloth after 6 p.m. and removing it before 8 a.m. has proved to be the most satisfactory. Failure to cover the plants completely each night or neglecting to cover every night also may result in irregular and delayed flowering.

Where temperature build up has been a problem, it may be solved by the following: (1) After sunset,

CULTURAL POINTERS

Gloeckner CHRYSANTHEMUM MANUAL

raise the end cloth long enough to leave trapped hot air out. Be sure to secure cloth again to obtain the required 12 hours of darkness. (2) Raise the supports for the black cloth to a height that will not permit the cloth to be within 10 inches of the flower heads. This will permit a more rapid exchange of air under the cloth. Cloth must be applied on pompons until all saleable flowers in the spray show some color and the largest flowers are partially open.

On standards and disbuds black cloth may be discontinued after all flowering buds have attained a size ½ to ¾ inch in diameter.

BLACK POLYETHYLENE FILM

To facilitate early outdoor planting, sterilize and cover the soil with black polyethylene in the fall. Direct planting with the film in place results in the added advantages of more uniform soil moisture, higher soil temperatures and reduction of weeds.

SHIPPING FLOWERS

Packing of cut flowers should be carefully studied. The most common error is over-crowding in the shipping boxes.

Quite often flowers from over-packed boxes have poorer keeping quality. This reduction results from bruised and crushed flower petals. Buyers will often complain that they cannot use the flowers without holding them in water for an extended period to regain turgidity in the crushed flowers.

Not securely fastening the blooms in the box will cause bruising of the petals. Cleating or sewing the stems to the box is essenial. Cushion the blooms by placing enough padded paper at the bottom of the corrugated box and between the layers of blooms. In order to give complete protection pompon bunches should be wrapped so that the paper extends 1 or 2 inches above the flower heads. Chrysanthemum "Saf-Pak" is very helpful in shipping standards to market. One dozen blooms are held securely in one "Saf-Pak" holder.

Long-distance shipments carry better if the cut flowers are packed dry. Reduction of the temperature is accomplished by precooling the packed cut flowers. Never ship wet flowers.

BANTAM MUMS

One of the many results of intensive plant breeding has been the BANTAM MUM type. This versatile mum produces acceptable flowers on 18 to 24-inch stems in a minimum growing period.

REQUIREMENTS:

- 1). Soil—Must be open, porous, well-aerated and steam sterilized on every crop. There can be no slow take-off and consequently soil preparation cannot be overemphasized.
- 2). Spacing—Summer, spring and fall flowering, 6 x 7 inches; early and mid-winter, 6 x 8 inches.
- 3). Culture—Plant shallow, provide constant moisture fertilization (preferably by injection method). Maintain a 65 degree F. night temperature for 30 days then 60 degrees F. until cut.
- 4). Pinching—Short days are started immediately and a high, soft pinch is made 18 days after planting. The soft pinch is especially important as flower buds are already initiated in the upper leaf axils at pinching time.
- 5). Other Advantages—a) No support is required. b)
 Let all breaks develop and no pruning is needed.
 c) Disbud early like pot mums, allowing one terminal bud to develop. d) Indianapolis varieties are an exception. Do not let more than three or four flowers per plant develop as overcropping will reduce quality in this group.
- 6). Marketing—The entire plant is cut at the soil line. This permits selling a multi-branched plant or a disbudded spray on a single stem base.
- 7). Careful varietal selection is most important. All varieties should possess these characteristics:
 - a). Free-breaking habit with great vigor and ability to stretch under short-day conditions.
 - b). Quick response at a night temperature of 60 degrees F. or lower.
 - c). Above average shipping and keeping qualities.

SHADING-PETAL BURN

When blooming chrysanthemums during high temperatures and high light intensity, it is advisable to cover the beds with a cheese-cloth stretched about 18 inches above the top of the developing blooms. This covering will also help keep dirt off the open blooms. Sunburn sometimes is confused with flower ray blight, which is caused by Botrytis. Botrytis is more abundant during periods of high humidity and low temperatures.

Adequate moisture at the roots will help prevent petal burn during the hot summer days.

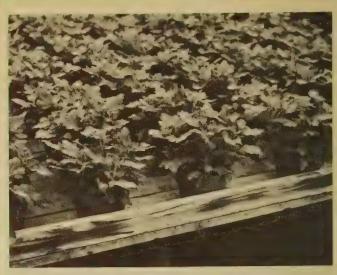

CULTURAL POINTERS

SUPPORTS

With high labor costs, it has become necessary to eliminate some of the labor in supporting standards and disbuds. The old way of supporting with stakes or stringing each plant has given way to the welded box-wire or cross-string method of support. Turnbuckles placed near the ends of the beds will keep the wires much tighter. Most growers are only using one layer of wire and cross strings and are gradually raising it as the crop grows.

Pompons are usually supported by the string and wire method similar to that described above.

Production losses because of failure to support the plant sufficiently or soon enough are not uncommon. Growth that is not vertical is often thin, weak and produces small leaves as a result of the excessive shade it receives. This type of growth even when supported properly will not produce satisfactory flowers. In cloth-house culture it is very important to

POT PLANTS GROWN ON BARE BOARDS

maintain the wire supports as close to the flower head as possible at all times to prevent breaking of the flower stem under the weight of moisture accumulation and wind pressure.

INSECTS AND THEIR CONTROL

APHIDS, OR PLANT LICE

All aphids are true sucking insects that insert their beaks through the surface of the leaf or stem and extract the juices from within.

Injury. The feeding of aphids causes the plants to become sickly and stunted. The leaves curl inward, and when the flower terminal is infested, the blooms will be deformed. Certain varieties of chrysanthemums are more susceptible to attack than others.

Control. Nicofume Fumigation is an easy method of controlling the black aphid but will do very little to control the green or straw-colored aphids. Lindane or Parathion is much more effective on the very resistant green or straw-colored aphids. Vapotone is also effective when used at higher concentrations. Thiodan and Malathion will also control aphid and spider mite.

CHRYSANTHEMUM LEAF MINER

The larva or maggot disfigures and weakens chrysanthemum plants by mining in the leaves. It may do considerable harm to the crop, but is easily held in check.

Injury. The young maggots burrow in the leaf tissue, leaving the upper and lower surfaces intact. The

tunnels are irregular and winding. White blotches are thus formed, which later turn brown, and the leaves may die.

Control. As soon as it is noticed that any leaves are infested, they should be picked off. Parathion or TEPP aerosol bombs or sprays containing Lindane, Chlordane or Parathion, are very effective.

CHRYSANTHEMUM MIDGE

The chrysanthemum midge is one of the most serious pests with which the grower has to deal. Under optimum conditions, a little over a month is required to complete the life cycle from the egg to the adult. The eggs are reddish-orange in color and are usually deposited on the tender tips of the growth. Under favorable conditions, the eggs hatch in about three days. The larva wanders about over the surface of the leaf for a day or two before finally penetrating into the leaf.

Injury. The midge attacks all parts of the plant but prefers the tender growth. If the infestation takes place when the plants are small, they fail to grow, although if the plants are well-developed when the infestation starts, the buds blight or are deformed, and the plant is rendered unsalable.

INSECTS AND THEIR CONTROL

Control. Lindane is effective against young and adults.

Parathion aerosols effective, but require frequent applications.

DDT effective against adults—repeated applications necessary.

CORN EAR WORM

The corn ear worm is a green to brown, nearly smooth caterpillar often mistaken for a cutworm when found within the buds or on the open flowers.

Injury. It is very destructive to the opening buds, for it feeds on their petals and other parts, deforming if not entirely ruining the flowers.

control. If the attacked plants are blooming, spraying is out of the question, but thorough treatment with a 3 or 5% D.D.T. dust is recommended. After they have worked their way into the buds and are found to be feeding on the open flowers, hand-picking is the only remedy. Spraying the plants with Deenate 50W will control them before the color shows. Parathion fumigation will also keep them under control.

CUTWORMS

The larva is dull colored and from one to more than 2 inches in length. They are most active at night, and usually spend the day coiled up just under the surface of the soil at the base of the plant. They should not be confused with the corn ear worm, which cannot be controlled by poison baits.

Injury. Cut worms obtain their food by biting out sections of the leaf, stem or bud. Various species attack different parts of the plant. The one that is most damaging climbs to the top of the stem and eats into the flower buds.

Control. Those cutworms that feed on the foliage can best be controlled with **Deenate 50W** spray using 1½ pounds to 100 gallons of water. **Parathion** has been suggested as a good control measure and is more effective as a spray.

GREENHOUSE LEAF TYER

It gets its name from its habit of spinning light webs inclosing 2 or more leaves or tying together the parts of a single leaf. This caterpillar is very active, and when disturbed, will wriggle off the leaf, often backwards, lowering itself on a silk-like strand.

Injury. When first hatched, the larvae eat out shallow holes on the under side of the leaf. As they grow, they enlarge these holes but usually do not cut through to the upper surface. The result is that the leaves become skeletonized.

Control. The best poison to control the larvae is Deenate 50W, either in the form of a dust or a spray. For liquid spray use 1½ pounds of Deenate 50W to 100 gallons of water. Regular fumigations with Parathion will keep the leaf tyer under control. Malathion is also effective.

MEALY BUGS

Mealy bugs are small, sluggish, whitish, soft bodied insects, measuring up to one-quarter inch long, found in clusters on the undersides of the leaves or in the leaf axils.

Injury. This pest sucks the juices from the stems and leaves, discoloring and deforming the foliage.

Control. Parathion or Dithio are the most effective. Repeated applications necessary.

MITES

Cyclamen mite and broad mite are often found on the same plants at the same time. Broad mite could pass through a complete generation in 4 to 5 days at 70 to 80 degrees, while the cyclamen mite will take 4 to 5 times longer.

Injury. Infested leaves become deformed, curl from the outside inward, and wrinkle so that pockets and pit-like depressions are formed. When the infestation is severe, the mites collect about the buds causing them to blight. Oftentimes white varieties will show occasional red petals.

Control. Endrin at 1-400 with DuPont Spreader Sticker 1-2000 gave excellent control. Kelthane also is effective. Systox used as a soft drench has been found effective in mite control. Thiodan is effective.

RED SPIDERS

There are several species of red spiders that attack the chrysanthemum. They vary in color through yellow, orange and red. The body is oval in outline and bears 8 well-developed legs.

Injury. Red spiders pierce the epidermis of the leaf and draw the liquid contents from the cells, causing the leaf to turn pale around the injured portion. They prefer to collect on the under surfaces of the leaves, which they cover with silken threads.

Control. Aramite, Chlorobenzilate, Tedion, Kelthane, Parathion or Malathion spray or Aramite, Chlorobenzilate, Dithio, Parathion or Malathion bomb.

INSECTS AND THEIR CONTROL

P40 at 3 pounds per 100 sq. ft. after plants are well established; especially desirable for cloth house operators, will also control foliar nematodes. Plantfume 103 smoke generators and Fulex Parathion Fumigators are simple to use and very effective. Dithio is much safer than other insecticides when used on open flowers. Alternating the insecticides will very often give better control.

SYMPHYLIDS

Symphylids are small white creatures about oneeighth to three-sixteenth inches long. About 40-60 days are necessary for the completion of the life cycle.

Injury. Symphylids destroy the fine root hairs and small rootlets, thus stunting the plants and often killing them outright.

Control. Complete control can be obtained with Lindane applied to the soil. Lindane can be applied to the surface of the soil either as a dust or as a wettable powder in a convenient amount of water. Application can be made when plants are in the bed, but best results are obtained if the insecticide is worked into the soil prior to planting. Use Lindane 25W at the rate of 8 ounces per 1000 ft. or 1% Lindane dust at the rate of 10 pounds per 1000 sq. ft.

SOWBUGS

Sowbugs often become so plentiful in the greenhouse that they eat the newly-planted cuttings at the base.

Any of the many poison baits will give partial control but a complete spraying with **Deenate 50W** under the benches has given excellent control.

TARNISHED PLANT BUGS

The tarnished plant bug or sting fly comes into the greenhouse through open doors and ventilators in late

summer or early fall and does considerable harm to this crop. Chrysanthemums growing in the open are frequently affected. Varieties such as Mary L. Hall and Sea Gull are attacked to a greater extent than other varieties.

Injury. It has sucking mouth parts and obtains its food by inserting its long, slender beak into the plant tissues and sucking up the contents of the injured cells, apparently injecting saliva, which causes the death of the tissue in the immediate vicinity. The stem is often slightly bent, and the terminal growth is malformed because of this injection.

Control. Early morning spraying or dusting with any of the pyrethrum materials will kill those bugs that are present but this will have to be done each day for complete eradication. Dieldrin and Malathion have been giving fair control, but again these insecticides are best used as a contact. Parathion fumigation will control this insect in the greenhouse.

TERMITES

Termites are not ants, though often called white ants. The food of termites is wood or cellulose. Soil inhabiting forms are the most common in the greenhouse.

Injury. Termites sometimes injure chrysanthemum plants by working up the center of the plant and hollowing out the stem. This injury will eventually kill the plant.

Control. Clean up all wood debris in soil. Replace old wooden benches. Keep wooden bench supports from direct contact with the ground.

THRIPS

The chrysanthemum is usually attacked by one or more species of thrips. These small, narrow-bodied, active insects which range in color from yellow to brown or almost black, injure both the leaves and the blossoms. Thrip are a real threat to Florida mum growers.

MITE INJURY

RED SPIDER INJURY

SYMPHYLID. ABOVE, ADULT — BELOW, EGGS AND YOUNG

INSECTS AND THEIR CONTROL

Gloeckner CHRYSANTHEMUM MANUAL

Thrips have mouth parts that are fitted for piercing and scraping the leaf surface and for sucking the juices and other cell contents. The upper surface of the foliage is covered with whitish blotches, while minute black specks appear on the lower surface. Unless a constant watch is kept on the plants and control measures are properly executed, thrips are capable of causing severe injury within a short time.

Deenate 50W used at the rate of 1 pound to 100 gallons of water is a very effective control. Other insecticides containing Lindane are also reccommended. Parathion will control the chrysanthemum and onion thrips. Regular dustings or spraying are necessary where infestation is heavy. **Dieldrin** is also very effective.

TARNISHED PLANT BUG

THRIP INJURY

ADULT ONION THRIP

PESTS AND THEIR CONTROL

FOLIAR NEMATODE

The spread of this pest has been very rapid in recent years owing to the increased trade in chrysanthemums and the ease with which the nematode is transported in plants and cuttings. Too few growers have become familiar with this pest, and consequently no effort has been put forth to control it.

The leaves attacked become blotched, turn at first greenish-yellow, then brownish, later gray and finally black until the entire leaf dies and hangs down on the stem. Under conditions of high

humidity both in the open during a wet season and under glass due to excessive watering, the spread of the pest may be extremely rapid.

Control. P40 applied at the rate of 3 pounds per 100 square feet has given good control. Wait 2 to 4 weeks after benching before applying. It is better to apply P40 in 2 applications, 11/2 pounds each time, 7 to 10 days apart. The latest findings show that foliar nematodes can be controlled with Parathion either as an aerosol or liquid spray. Systox emulsion applied as soil drench 2-4 weeks after planting is effective.

DISEASES AND THEIR CONTROL

MILDEW

Symptoms. Whitish powdery growth on upper surface of leaves.

Control. Spray at regular weekly intervals with a good wettable Sulfur, 11/2 pounds per 100 gallons of water to which a good commercial spreader has

been added. Spray with Mildex 4 ounces per 100 gallons of water plus spreader whenever disease appears.

BACTERIAL WILT OR STEM ROT

Symptoms. Plants in all stages of growth may exhibit symptoms. In newly-planted cuttings it first appears

DISEASES AND THEIR CONTROL

as early wilting. Examination of cuttings will show the stems to be filled with a soft jelly-like, often red-colored mass. Stems may crack open in later stages and as the soft jelly dries it leaves the stems hollow. Breakdown of the infected plants may start at the location of a pinch and work down and out into breaks from pinch. Complete loss of the plants is not uncommon. In most cases, plants will wilt at some stage of the disease's progress causing the growth to be retarded, but it is possible for wilting to occur as late as flower opening.

Control. Remove and burn immediately all affected plants. Avoid pinching wet plants to prevent spread of the bacteria. Since it is a disease that attacks soft tissue during rapid growing periods of the year avoid excess use of ammonium fertilizers. Avoid dipping cuttings. Exercise care in variety selection for this period whenever possible.

BASAL STEM ROTS

- Symptoms. One of the disease is accounting for a high loss of plants and production during the high humidity, high temperature periods of growing. One of two fungi are involved:
 - (1) RHIZOCTONIA: May be distinguished by the following:
 - (A) The decay originates near the soil surface rather than in the root system;
 - (B) The diseased area has a brown coloration from the branches of the organism;
 - (C) Strands of mycelium can be seen with a hand lens;
 - (D) Where plants are crowded such as in a propagating bed or container the fungus can form a strong, brown-colored web over the plants, and
 - (E) The expression of the disease is often rapid and may rot mature plants upward from an infection at soil line.
 - (2) **PYTHIUM:** May be characterized by the following symptoms:
 - (A) Rotting may start at the root tips;
 - (B) Does not produce a characteristic color; roots will be brown and black depending on the various stages of decomposition. Rapid blackening of stem on actively growing plants is not uncommon;
 - (C) May destroy the root system slowly causing a slow retardation in growth; and
 - (D) In almost all cases the root system has stood in water for some time.

Field observations often reveal both **Pythium** and **Rhizoctonia** attacking the plant at the same time. Spread of the organisms is through transfer of plants, tools and soils. Next to poor soil aeration and inadequate drainage, high salt concentrations are known to increase the severity of expression. The

most severe symptoms of the disease are usually found on the beds having an uneven soil surface permitting surface water pockets. In ground beds of a cloth house the greatest incidence will be found in that part of the bed where surface runoff flooding was permitted. In both cases the excess of water seals the soil and provides conditions favorable for both diseases.

Physical Control. Supply better than just adequate drainage for all beds. Time taken in soil and bed preparation is money spent on insurance towards the success of your crop. In cloth houses slightly raised beds aid in preventing flooding and provide additional insurance for proper aeration where you have no control over soil moisture. Remember, these diseases can be transferred from diseased areas to new areas on any type of equipment or tools.

Chemical Prevention. Broadcast TERRACOLOR (75% wettable powder) at 2 pounds per 1000 square feet before planting and mix thoroughly into the top 2 inches of soil. This may also be used as a soil drench prior to, or at time of planting. Use Terracolor at the rate of 2½ pounds per 300 gallons of water and apply to 1000 square feet of bed area. It should be recognized that this treatment is not a control for plants expressing symptoms but a preventative treatment.

FLOWER ROTS

(1) RAY BLIGHT

- Symptoms. Caused by a fungus, Ascochyta chrysanthemi, which may attack any part of the chrysanthemum plant during its normal growing cycle. The name RAY BLIGHT is derived from the fact that noticeable expression is most often on the ray florets of a developing flower.
 - (A) Petals on one side of the flower turn dark brown or black from their base outward and tend to stick together.
 - (B) Rot may progress down the flower stem.
 - (C) Blossom falls apart.
 - (D) The leaves and unopened buds also may be attacked, producing a mushy, black-brown spotting and rotting under continued moist and moderate temperature conditions. The rot may extend from the leaves into the stem causing a brown to black lesion which may eventually girdle the stem and cause death at the top of the plant. In severe cases rot will weaken the stems sufficiently to permit flopping over of the flower heads.
 - (E) The infected leaf tissue may resemble Septoria leaf spot but it is usually distinguished by the lack of circular spot pattern common to Septoria and the presence of yellowing of tissue next to an infection of Ascochyta.

CHRYSANTHEMUM MANUAL

DISEASES AND THEIR CONTROL

The fungus can withstand extremes of temperature and moisture and can lie dormant for prolonged periods and yet be destructive when reactivated.

Control. When the crop is finished, thoroughly clean the growing area and destroy all chrysanthemum tissue collected. Once the fungus infects the flowers no applications of fungicidal sprays can stop the disease therefore it is essential that a regular prevention program be followed. Lower the humidity as much as practical and spray on a regular schedule until buds show. At bud appearance alternate spraying the flower from below and above using PARZATE and ORTHOCIDE 50W at one ounce per 4 gallons of water plus one-third teaspoonful of DuPont spreader-sticker. This should be repeated at no less than 5-day intervals. In cloth houses rains should always be followed with sprays regardless of frequency. However, if frequency is occurring closer than 5-day intervals reduce the quantity of spray material and the spreader sticker to ½ the regular rate. During periods of excessively high humidity additions of MANZATE ½ lb. per 100 gallons of water also has been effective. There is some evidence to show that CAPTAIN (ORTHOCIDE 50W) will produce fading of open flowers more readily than Parzate. Fading of flowers also has been reported by growers when excessive use of stickers and spreaders has been permitted.

(2) BOTRYTIS

- Symptoms. The organism may attack any part of a chrysanthemum plant during its normal growing cycle and frequently cause the greatest losses on mature flowers in transit. Expression of the disease varies considerably from Ascochyta.
 - (A) It does not attack the flower bud from the inside and is usually found on a more mature or fully-opened flower.
 - (B) Foliage infections are characteristically soft brown and upon drying do not have any distinguishing features.
 - (C) Botrytis is found most often on the foliage shaded in the center of the bench.
 - (D) Mature infections will produce visible threads of mycelium that upon drying are white in color.
 - (E) The organism most readily attacks injured tissue such as that burned from excess of fertilizer and sunburn.

Control. Reduce the quantity of free water that stands on flowers and foliage as much as possible. Do not ship moist flowers.

Spray regularly with **PARZATE** and **ORTHOCIDE 50W** at same rate and frequency used for Ascochyta control. **CM19** may also be used as a foliar spray. **CM19** has been successfully used as a Botrytis eradicant when applied frequently to Botrytis susceptible, lower foliage of the plants at the rate of one pint per 100 gallons of water.

ROOT KNOT NEMATODE

- Symptoms. Nematodes or eelworms bore into the roots of the plants and cause knots or galls to develop on the root systems. As a result the plants are weak, yellowish and stunted in growth.
- Control. Steam sterilization of the soil is the most effective. MC2, VAPAM, VC13, D-D, EDB and NEMAGON are chemical soil sterilizing materials that have given good control of root knot nematodes.

RUST

- Symptoms. Chocolate brown powdery pustules on lower surface of the leaves.
- Control. PARZATE, one ounce to 4 gallons of water is most effective.

SCLEROTINA

Symptoms. The organism is easily recognized by the dense, white wet-appearing, cottony mass-like growth in which are found hard black seed like sclerotia. Under field conditions air-borne spores develop and subsequent infection makes it more difficult to control. Expression of the disease is rarely seen on greenhouse chrysanthemums and then only when poor regulation of temperature and humidity prevail.

Under cool, moist, often prolonged foggy periods in the field it will attack mature, healthy plants and cause death of plants through wilting.

Control. Ventilate properly. Remove the infected plant material and burn. Spray lower foliage with TER-RACOLOR at the rate of 1½ to 2 pounds to 100 gallons of water. Be careful to clean up and burn all crop residue. Hard sclerotia are able to reinfect plants years after the initial infection.

SEPTORIA LEAF SPOT OR LEAF BLIGHT

- Symptoms. Distinct circular spots on the foliage. These are grayish-brown in color and become brittle in the center. Affected leaves may turn yellow and die. The disease is more prevalent in the open. Some varieties are more susceptible than others. The variety, Sea Gull is very susceptible.
- Control. When cuttings are received, dunk the tops into FERMATE (2 tablespoons to a gallon). Spray the plants with PARZATE at the rate of one ounce to 4 gallons of water plus one-third teaspoonful of DuPont spreader-sticker every 10 to 14 days. Cloth house mums should be kept covered until the buds can be seen.

DISEASES AND THEIR CONTROL

VERTICILLIUM WILT OR SEIDEWITZ DISEASE

Symptoms. Margins of leaves turn yellow and eventually wilt or dry up. This begins at base of plant and works up the stem. May affect one side of a stem or plant more than the other. No distinct spots. Varieties vary in resistance to this disease.

Control. Verticillium wilt can be avoided by purchasing our disease-free cuttings produced from cultured stock. It is also necessary to plant only into sterilized soil.

VIRUSES

The word "virus" is being referred to by the medical profession as well as by the florists, and a short explanation of virus should prove of interest.

Viruses of the chrysanthemum are considered to be infectious; that is they can be transmitted to a healthy plant only by contact with an infected plant. They are not carried in the soil, water or air as are other diseases caused by fungi and bacteria.

The virus particles cannot be seen by the most powerful microscopes. Most of them will pass through bacterial filters. They respond like living organisms. They are always present in the sap of diseased plants

and can be transmitted to a healthy plant through wounds or by mechanical means. The chrysanthemum is known to be affected with 5 viruses, namely yellows, Aspermy, rosette, mosaic and stunt. Stunt is the only one that has caused much concern. It has been found that aphids as well as mechanical handling will cause stunt to spread.

Once a plant is infected with a virus, it usually always remains affected. To define a virus, the following is as good as any: A virus is a protein which requires the presence of living cells for multiplication and it causes changes in the structure and functions of living cells.

COMBINATION SPRAYS

At times it is more economical and convenient to mix two or more sprays and apply them in one operation. Before such mixtures are prepared, the grower should be sure no reaction harmful to the plants will occur, and that the efficiency of the separate ingredients is not reduced. Consult your State Entomologist or Plant Pathologist for information on combination sprays for specific crops.

A good combination spray for chrysanthemums which will control most diseases and insect pests, can be made with Lindane, Parzate, DDT and Vapotone. Details on dilutions are as follows:

AMOUNT TO MAKE							
100 GALLONS	20 GALLONS	3 GALLONS					
6 oz.	2 tablesp.	1 teasp.					
1 lb.	3 ounces	1½ tablesp.					
1½ lbs.	5 ounces	2 tablesp.					
2 lbs.	6 ounces	3 tablesp.					
½ pt.	3½ tablesp.	1½ teasp.					
	6 oz. 1 lb. 1½ lbs. 2 lbs.	100 GALLONS 20 GALLONS 6 oz. 2 tablesp. 1 lb. 3 ounces 1½ lbs. 5 ounces 2 lbs. 6 ounces					

^{*}Parathion, Aramite or Endrin may be used in place of Vapatone in this combination spray.

To prepare: (1) Measure out spreader and dilute in small quantity of water. (2) Fill tank with required water and add the diluted spreader and stir. (3) Take out a small amount in jar, add the proper amount of Parzate and shake vigorously until all the powder is thoroughly wetted. (4) Pour this mixture back into the tank, preferably through a fine screen or cheesecloth and stir. (5) Measure out Vapatone and dilute in small amount of water and add to the tank. Keep stirring or keep agitator running while adding the materials.

MATERIAL AND AMOUNT (per 100 gallons of water for spraying)

- 1. 2 pounds 15% Aramite wettable powder
- 2. 1 pound Captan wettable powder
- 3. 1 pound Chlordane 50% wettable powder
- 4. 1 pound 25% Chlorobenzilate wettable powder
- 5. 1 pint CM19—Emulsifiable solution
- 6. 2 pounds 25% Diazanon wettable powder
- 7. 2 pounds 50% **DDT** wettable powder
- 8. 1 pound Dieldrin 25% wettable powder
- 9. 1 pint 25% **Dimite** emulsifiable solution
- 10. 1 quart Endrin emulsifiable solution
- 11. 1½ pounds Fermate wettable powder
- 12. 1 pound 25% Lindane wettable powder

- 13. 1½ pints 50% Malathion emulsifiable solution
- 14. 2 pounds 25% Malathion wettable powder
- 15. 1½ pounds 15% Parathion wettable powder
- 16. 1½ pounds Parzate wettable powder
- 17. ¼ pint 40% TEPP emulsifiable solution
- 18. ½ pint 20% TEPP emulsifiable solution
- 19. 1 to 1½ pounds 25% Kelthane wettable powder
- 20. 1 pint 25% Kelthane emulsifiable solution
- 21. ½ pint Systox emulsifiable solution
- 22. 1 pound Tedion 25% wettable powder
- 23. 1 pound Terraclor 75% wettable powder

YEAR-ROUND FLOWERING OF CHRYSANTHEMUMS

For the past thirteen years we have seen cut chrysanthemums on the markets every month of the year. To assure high quality cut flowers the plants must be grown under optimum conditions. By optimum conditions we refer particularly to the basic conditions of a good soil, the disease-free condition of the plant material, the absence of any checks in growth from stock plant to the mature flowering plant, adequate means of temperature control for all stages of growth and the selection of the right varieties out of each group for the respective flowering periods. It is with this in mind that we prepare this Manual.

Response Group

Prior to year-round flowering of chrysanthemums, we

referred to varieties as to their natural flowering date. Now that year-round flowering is in general use, we refer to a variety as to its response to short-day treatment. When we say 9 week response, we mean that it will bloom 9 weeks after the short-day treatment is started. A 13-week group requires 13 weeks after short-day treatment is started, and so on with all the other response groups.

Daylength Control

When chrysanthemums are grown around the year, it is very necessary that we know when to apply shade or light to make the plants respond as we desire. The following schedule will give you the proper dates for lighting and shading for each response group.

YEAR-R	YEAR-ROUND LIGHTING AND SHADING SCHEDULE							
RESPONSE GROUP	SHADING TO STOP IN FALL	LIGHTING TO START IN FALL	SHADING TO START IN SPRING	LIGHTING TO Stop in Spring				
7 WEEK	AUG. 22	JULY 11	APR. 11	MAY 30				
8 WEEK	AUG. 29	JULY 18	APR. 4	MAY 23				
9 WEEK	SEPT. 5	JULY 25	MAR. 28	MAY 16				
10 WEEK	SEPT. 12	AUG. 1	MAR. 21	MAY 9				
11 WEEK	SEPT. 19	AUG. 8	MAR. 14	MAY 2				
12 WEEK	SEPT. 26	AUG. 15	MAR. 7	APR. 25				
13 WEEK	ост. з	AUG. 22	FEB. 29	APR. 18				
14 WEEK	OCT. 10	AUG. 29	FEB. 22	APR. 11				

Lighting

The chrysanthemum is generally referred to as a short day plant but it is rightfully a long night plant. It requires a long night period of at least twelve hours or more to bud and flower properly. When we want to prevent bud initiation we should reduce the night period to at least seven hours. This is done by lighting the plants three to four hours each night, starting at 10 p.m.

To prevent the initiation of flower buds, the light intensity must not be lower than 7 foot-candles. When growing seven or eight week varieties this minimum should be 9 foot-candles.

Usually we figure that it requires 1¼ watts per sq. ft. of area covered; that includes benches and walks. When lighting a single bench 42 inches to 48 inches

wide use 60-watt lamps in a reflector, spaced 4 feet apart, 2 to 3 feet above the tops of the plants. For two benches 42 to 48 inches wide use 100-watt lamps in a reflector, spaced 6 feet apart, 2 to 3 feet above the tops of the plants.

Lights must be used according to the schedule above. It has been found that best results are secured by interrupting the night. Begin lighting at 10 p.m. for the number of hours shown below:

Additional Lighting Schedule

- 3 Hours during the months of August, September, October, March, April and May.
- 4 Hours during the months of November, December, January and February.

YEAR-ROUND FLOWERING OF CHRYSANTHEMUMS

Shading

Use a good durable **Black Cloth** which when applied will reduce the light intensity to 2 foot-candles or less. More light intensity than this will result in delayed flowering and unevenness of bloom.

The cloth should be applied at 5 p.m. and removed at 8 a.m. When the temperature is above 90 degrees at 5 p.m. delay the application of the cloth until 6 or 7 p.m. This will reduce the heat under the cloth and yet produce twelve hours or more of night necessary for proper development. Continue covering each evening on pompons until the latest buds show color and most of the flowers are well developed. For large flowering varieties, shading can be discontinued after all flowering buds have attained the diameter of approximately one-half inch.

Be sure that covering is complete on all benches shaded, as any leaks in light will cause uneven spots in the bench at blooming time.

Black cloth should be applied each evening. Missing one night a week will give fair results, but delayed flowering results when cloth is not applied each evening.

Temperature Control

For inter-connected units or crops at different stages of development the most efficient and effective temperature recommendations we can make are **cool 60° crops**. The house temperature is run at a straight 60° level night and day, cloudy or sunny. This is the lowest, safest minimum. It is the night temperature that counts. Eliminating fluctuation promotes steady, gradual growth. Keeping day temperatures down encourages more ventilation with corresponding reduction in relative humidity. This promotes stronger, heavier stems. On very bright days temperatures will

frequently go higher but this should be due to radiant heat from the sun rather than convective greenhouse heat.

Excessive high temperatures prohibit the bud development, and during seasons of 90 degree night temperatures, it is suggested that the black cloth be raised after twilight and lowered again in the morning before daylight. This cooler temperature hastens the development of the buds. Air conditioning greenhouses has made it possible to grow chrysanthemums in locations where natural high temperatures prohibited the development of this crop.

Selection and Varieties

The careful selection of varieties in year-round flowering is very important. An intimate knowledge of varieties will eliminate the pitfalls associated with this crop. Knowing how to select varieties on the basis of response groups is equally as important as selecting varieties that will respond out of season.

In latitudes where seasons, temperatures and light conditions are variable, it is to any grower's advantage that he grow only those varieties that will provide the highest yields and best quality for each period of the year.

The South is of course more fortunate in that light duration there and intensity fluctuates less than is experienced in the North, and even though only three or four response groups are used during a 52-week period, the need for meticulous varietal planning is just as important as it is for any one period in the North.

Your **Gloeckner** representative is well equipped to furnish you the details and the proper varieties for each particular flowering date. His intimate knowledge will eliminate the guess work associated with mum programming.

WELL GROWN YEAR-ROUND CROPS-NOTE LIGHTS AND BLACK CLOTH

YEAR-ROUND FLOWERING OF CHRYSANTHEMUMS

Gloeckner CHRYSANTHEMUM MANUAL

INTERRUPTED LIGHTING FOR WINTER STANDARDS

When flowering December thru March crops of the standard varieties Indianapolis, Queen's and Mefo's the use of interrupted lighting has been tested and is recommended as a means of increasing petallage. This materially improves the appearance of the flower reducing the effect of decreased petallage and quilling known to be associated with abrupt shade during the short days of the winter period.

The essential requirements are:

- 1. Units planted to only the above mentioned varieties. The procedure has not been thoroughly tested on spray varieties or other standard varieties.
- 2. Accurate control of temperature. A 60° minimum night at all positions within the unit plus correspondingly higher day temperatures. Cloudy days were run at the 60° minimum. Bright days were between 65°-70°.
- 3. A rigid adherence to scheduled timing recommendations with interruption.
- 4. No extreme temperature reduction at or near the finish of the crop. Low temperature is known to be partly responsible for an increase of quilling in the Indianapolis varieties. A minimum of 55° is satisfactory only after buds show some color.

5. The method recommended is as follows:

For any given crop to be flowered during the **December through March** period determine from the schedule the date lights are stopped. Count back twelve (12) days and on this date start and maintain nine (9) continuous short days of no lights. At the end of this nine (9) short day period run twelve (12) continuous days of lights on. Then turn lights out and maintain normal short days.

Thus the total number of long days as called for by the schedule remains the same. This second long day period immediately following the first short day period of nine (9) days serves to slow down the early bud development stage resulting in a petallage increase of approximately 50%.

To illustrate: For flowering Indianapolis White (10 week) for December 12 the schedule calls for October 3 lights out. Counting back twelve (12) days gives September 20. Therefore run short days from September 20 to and including September 29 (9 continuous short days). Starting September 30, run twelve (12) long days to and including October 11. On October 12 start the final and continuous short day period. This is the nine (9) short day—twelve (12) long day formula for interrupted lighting.

CHRYSANTHEMUM POT PLANT CULTURE

Gloeckner CHRYSANTHEMUM MANUAL

SOIL

A good fibrous silt loam direct from the field, to which one-third to one-half of well rotted manure or German peat has been added, plus an application of superphosphate or a low nitrogen, complete fertilizer will give excellent results. In areas where such soil is not available a heavier soil may be improved by additions of sand or perlite to the soil. Since perlite holds large quantities of air, and moisture, a little experimentation will usually show the correct mixture. Remember there is no fertilizer program

PRINCESS ANNE

available that can produce vigorous growth and the desirable dark green luster on the foliage if the soil does not provide sufficient aeration. Some growers are getting quicker root action by using a top dressing of one-half inch of German peat over their regular soil mixture in each pot and planting through this mulch. It saves on watering and assists in producing more breaks after pinching.

In many areas peanut hulls, sawdust or wood shavings are excellent alternate sources of organic matter. Additional nitrogen feeding is necessary at the beginning of the crop.

WATERING AND HUMIDITY

Plants should always be set in soil that has been uniformly moistened, either by sterilization or natural wetting. Some growers prepare pots a day ahead to assure the correct level of moisture in each pot prior to planting. After planting, water thoroughly to set the soil around the roots. The additions of peat and perlite to the original soil will improve water retention and help eliminate extreme fluctuations in moisture supply. Chrysanthemum plants can be overwatered as easily as poinsettia plants. Overwatering results in the death of roots and the yellowing of foliage. The variety of Oregon is used by some growers as an indicator, since it shows these symptoms quickly. In order to assure adequate moisture and humidity prior to pinching and during the lighting period, many growers place cuttings under intermittent mist after potting. This eliminates initial watering and assists in developing more and stronger breaks. With this system no supplemental shading is necessary on young plants.

CHRYSANTHEMUM POT PLANT CULTURE

For best results grow all potted chrysanthemums under glass. Do not shade the glass any more than necessary. Usually a light shade is necessary in midsummer and particularly on plants approaching the

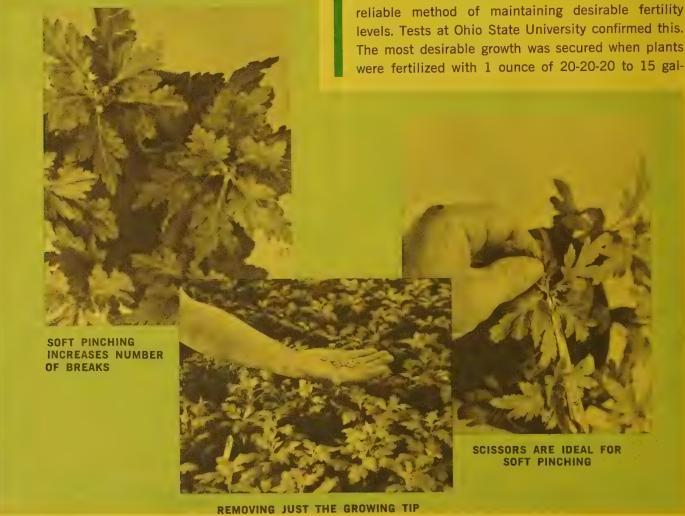

AMPLE SPACE BETWEEN POTS IS NECESSARY

finishing stages. Shade on the glass is usually for the comfort of the grower, rather than for the requirements of the plants. Maintain humidity in the house by wetting down benches and walks.

FERTILIZING

The foliage should retain a bright green luster throughout the life of the plants. The lower leaves should never be allowed to become pale green as a result of low fertility. A strong, well-grown pot plant is a well-fed plant. Pot plants should be fed more frequently than those grown in a bench, as constant leaching lowers the nutrient level in pots faster than in bench culture.

Liquid fertilizers are very effective. Constant fertilization by means of injecting small quantities of fertilizer into the water line has eliminated the tendency to fluctuate the quantities of fertilizer available to the plant. Fertilizing every time the plants are watered with a **Fert-O-Ject** has proved to be a reliable method of maintaining desirable fertility levels. Tests at Ohio State University confirmed this. The most desirable growth was secured when plants were fertilized with 1 ounce of 20-20-20 to 15 gal-

CHRYSANTHEMUM POT PLANT CULTURE

lons of water each time they were watered. With this system young cuttings may be watered-in with the same solution as that used on older, established plants.

When an injection system is not available, regular weekly feedings with liquid fertilizer are recommended. The last fertilizing is as important as the first one. In many cases pot mums not having correct fertility at finishing time lack keeping quality. This is especially true if the pot has not had adequate fertility levels maintained during the growing period.

TEMPERATURE

The optimum night temperature is 65 degrees F. Day temperatures should be 75 to 85 degrees F. when the light intensity is high and 70 degrees F. on cloudy days. Heat delay occurs when night temperatures reach 90 degrees or higher. This condition is similar to the check that results when plants are removed from the short-day treatment too early, when black cloth treatment is missed too often, or when old shading cloth is used.

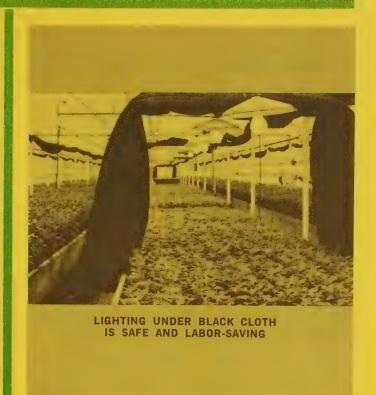

Some of the delay may be overcome by placing black cloth over the plants with as much headroom as possible to increase air movement under the cloth. Ground beds with cloth placed 6 feet above pots is satisfactory. The only positive method to overcome this heat check is to install air conditioning to lower the temperatures. Where this is not possible, variety selection is extremely important.

Growing the crop at less than 65 degrees F. night temperature results in uneven and delayed flowering. A gradual temperature drop to 55 degrees F. after buds show color is recommended for most colored varieties.

Extreme fluctuation of night temperatures above 65 degrees F., and below 54 degrees F. will retard flowering especially in the later stages of bud development.

SHADING AND DISBUDDING

Use the same procedure as for cut flowers. Black cloth treatment should continue until disbudding.

For medium-height varieties pinching is done the same day that short-day treatment is started. However, if plants are too tall, delay the pinch 10 to 14 days after the start of short days.

The time of disbudding pot mums must be stressed. Late disbudding produces a shock to the plant that can affect flower size, timing and color. Several days delay in disbudding is equal to more than several days delay in flowering during high temperature periods of the year. Generally it is necessary to make two passes at disbudding; the first is made as soon as the terminal bud cluster has opened enough to permit side-bud removal without injury to the terminal bud. The second disbudding removes any lateral shoots that are stimulated into growth after removal of the first set of side buds. The commonly used garden varieties are not disbudded when they are used for Easter and Mothers' Day pots since the flower size is not large enough to make a show, and the beauty lies in the number of flowers contained on the bushy plants.

PLANTING AND PINCHING

Planting only those cuttings directly into the pots which have been graded for height and stem diameter

CHRYSANTHEMUM POT PLANT CULTURE

is the beginning of top quality pots. Uneven growth resulting from differences in cuttings within a pot is not easily corrected in the later stages of growing. Deep planting results in greater susceptibility to Rhizoctonia and Pythium. Uneven planting depths among cuttings within a pot also will produce uneven growth responses within the same pot. It is better to plant cuttings in a circle around the pot rather than the four with one in the center. Planting cuttings on an angle generally increases the number of breaks that develop from the initial pinch. Failure to achieve the proper number of strong breaks from the first pinch often can be traced to pinching plants which were not vigorously growing at time of that pinch. Frequently the clue to this trouble is the number of plants that require an additional pinch because the first pinch simply removed a portion of the leaf rather than the entire growing tip. If active growth does not occur, and the schedule calls for a pinch, it would be better to delay the pinch, until the plant has made sufficient new growth. The slight delay in flowering time is insignificant compared to the reduction in quality that results from improper pinching.

Hard pinches on actively growing plants often reduces the number of breaks. No more than $\frac{1}{2}$ inch

of stem tip should be removed from the plant when pinching, and best results occur when the tip is simply "rolled out." The pinch should be made only on growth that has occurred in your greenhouse. The accompanying photographs illustrate this technique.

The use of intermittent mist on plants in the early stages helps to establish cuttings rapidly, and breaking action is improved.

SINGLE STEM METHOD

Plant 7 or 8 cuttings per 6-inch pot or 10 cuttings per 8-inch pot making sure they are uniformly graded prior to planting. Do not pinch. This permits a saving of one to three weeks growing time over the pinch method. Disbud to one bud per plant as early as possible. Total growing time is approximately equal to response classification of the variety. One advantage of the single-stem method crop is the increase of one more crop per year over the pinched crop system. Blooms will be very large and the stems will be much stronger than with pinched plants. Varieties recommended for single stem culture are: Malou, Mrs. Wolfe, Princess Anne, Clipper, Loubens, Cossack, Red Star, Vulcan and Perle Angevine.

SINGLE-PINCH METHOD

Considered the standard method, this system produces a mass of flowers on stocky plants. Plant 5 or 6 rooted cuttings per 6-inch pot. Roll-pinch the plants in the soft growth according to the schedule found in the year-round program.

TIMING PINCH AND SHORT DAYS

In most localities the desirable height of the finished pot is between 17 to 20 inches overall. In order to achieve this height it is necessary to vary the pinch in relation to the beginning of short days according to each variety. All varieties are classed by their natural growing habits.

TALL GROWING VARIETIES (varieties naturally flowering on stems 15 inches and over after short days have been applied.

CHRYSANTHEMUM POT PLANT CULTURE

Treatment: Short days applied 10 to 14 days prior to pinching to reduce height. (Example: Snow Crystal)

MEDIUM GROWING VARIETIES (varieties which naturally flower on stems no longer than 15 inches after short days have been applied).

Treatment: Short days applied the date of pinching to maintain natural height. (Example: Bonnaffon Deluxe)

SHORT GROWING VARIETIES (varieties which naturally flower on stems under 15 inches after short days have been applied).

Treatment: Short days applied after 7 to 14 long days following pinch have occurred to promote the additional stem growth needed. (Example: Delaware)

The year around schedule in this manual takes the above into consideration so that all plants should finish at approximately the same height. Seasonal variations occur—check with your Gloeckner representative before scheduling your program.

TWO-PINCH METHOD

The most common method a few years ago and still used some for natural bloom, especially where larger plants are wanted. Plant 4 cuttings per 6-inch pots; 5 per 7-inch, or 7 in 8-inch pots. Pinch plants the first time 14 days after planting and wait 21 days and pinch the second time. Short-day treatment should start at the time of the second pinch.

SOME COMMON ERRORS

1. GROWING UNDER TOO MUCH SHADE OR CROWDING PLANTS. During low light intensity periods of the year a minimum of 1½ square feet per 6-inch pot is required to finish a quality pot. Some larger growing varieties require more space. Crowding results in spindlier plants, increased susceptibility to foliage and flower diseases, reduction in keeping quality, and yellowing and loss of lower foliage.

PENINSULA-TYPE BENCHES OFFER MANY ADVANTAGES

Excessive shading from dirty glass or too much shading compound will produce similar results. Crowding or excessive shading produces a carbohydrate-deficient plant. DON'T CROWD POT MUMS!

2. Loss of Root System:

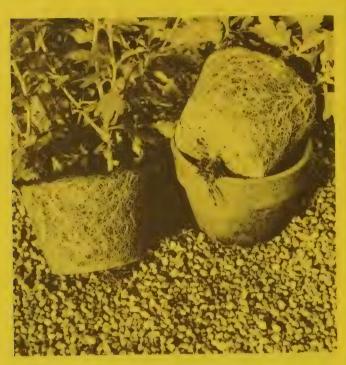

The early loss of roots often causes a severe check resulting in the production of sub-standard pot mums. Frequently the check is not uniform within a pot causing the pot to be noticeably uneven. This is especially true if the loss is caused by excess fertilizer applications.

(a) By Excess Fertilizers

When excessively high soluble salt concentrations build up in the pots, both leaves and roots can be injured. Leaf margin burning is an expression of this damage.

Next to crowding, more pots are reduced in quality from excess fertilizer applications than any other cause.

CHRYSANTHEMUM POT PLANT CULTURE

GOOD ROOTS RESULT FROM CORRECT WATERING AND FEEDING PRACTICES

(b) By Overwatering

Overwatering usually resulting from lack of proper drainage can cause loss of roots. Plunged pots are

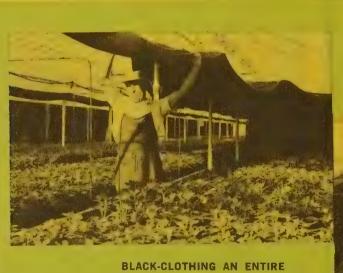

more easily overwatered than non-plunged and for that reason the bench on which plunging is being done should have excellent drainage.

3. Failure to disbud promptly:

Varieties differ in their response to late disbudding but generally the results are late flowering, color loss, and in some cases, ragged foliage resulting from injury incurred during disbudding procedure. Late disbudding on single-stem crops can contribute to undesirable height of finished plants and marked reductions in flower size and color.

4. Root pruning resulting in loss of keeping quality:

This type of injury most often occurs where plants are grown plunged until flowering and have not been turned regularly to maintain a root system within the pot. Plants that have been root-pruned are not able to maintain proper internal moisture relationship even when the soil is wet. Frequently the buyer of such plants will complain of short life and the necessity of watering too often. Root-pruned plants will become nitrogen deficient very rapidly which also contributes to the lowering of general appearance and keeping quality of the pot.

HOUSE IN ONE OPERATION

Gloeckner CHRYSANTHEMUM MANUAL

CHRYSANTHEMUM POT PLANT CULTURE

Garden Mum Pot Plants for Mother's Day

Garden mum plants in full bloom make ideal potted plants for Mother's Day. This should be a valuable addition to the list of spring pot plants. For best results, 5 cuttings should be planted in a 6-inch pot or 2 cuttings in a 4-inch pot. After these pot plants are through flowering, they should be cut back to within

3 inches of the soil level and planted into the garden. These same plants will bloom again in the fall.

Many growers have greatly increased their sale of garden chrysanthemums by having collections in bloom during the spring season. Cuttings are planted one to a 3-inch or 3½-inch pot using the procedure outlined below for Single-Pinch Method.

SINGLE - PINCH METHOD*

	BLOOM	PLANT	LIGHTING PERIOD	PINCH	SHADE
EASTER	(APRIL 17)	FEBRUARY 8	FEB. 8 - FEB. 15	FEB. 15	NO
MOTHER'S DAY	(MAY 8)	FEBRUARY 29	FEB. 29 - MAR. 7	MAR. 7	APR. 4
MEMORIAL DAY	(MAY 30)	MARCH 21	MAR. 21 - MAR. 28	MAR. 28	APR. 4

^{*} For double-pinch method plant five weeks earlier and give first pinch seven days after planting. The second pinch should be made on the pinch date given in the single-pinch method. Be sure to light from the date of planting until date of second pinch.

Variety—Description

Flowering Date

GARDENIA

S-2

Large white decorative. Valuable spring and summer pot.

GRANITE STATE

Oct. 25

S-2

White disbud pompon for pots.

WEEK & QUICKSILVER

Oct. 25

S-2

S-2

P-1

Large decorative. Pure white. More durable, uniform and prolific than Wilson's White and at least a week earlier than Oregon.

Oct. 25 MONTY

Intermediate clear white disbud decorative. Outstanding in the spring.

P CREST Oct. 25

Medium sized formal pot disbud. Ivory white.

Nov. 1 **S-4** QUEEN'S LACE

White spider. Tolerates 56°.

S-5 WILSON'S WHITE Nov. 1

Large paper white decorative. Consistently dependable for uniform response but intolerant of overcropping.

Nov. 1 **S-2** LUNA

Small light cream incurve. Compact and uniform.

Large white semi-incurve. Stronger habit, larger

PATTERSON'S WHITE

Nov. 1

Large white decorative.

MALOU

Nov 1

Intermediate incurve. Chalk white. Extremely short habit and strictly a pot variety. Pinched crops require high light environments. Best as a single stem pot where its beautifully rounded, incurved form has unlimited appeal.

SNOWCLAD

Nov. 1 **S-5**

Portrait size paper-white decorative. Tolerant of 56°.

POITEVINE SUPREME—New

Nov. 1

Intermediate white decorative. Wilson's White restyled and formalized. Petals are broad, completely incurved and not twisted or reflexed.

PERLE ANGEVINE—New

Nov. 1 P-1

Tightly incurved lavender pink standard. Very short growth suited to single stem pots. Best April through December. Will go blind in Northern winters. Pinched pots require maximum light, space and short day treatment. Available June 6, 1960.

OREGON

Nov. 5

S-8 (NA) SNOW CRYSTAL

Nov. 5

Medium ivory white spider. Feathery spooned petals. Captures much of the delicate Snowdrift form from which it was bred. Strong habit, and

wiry stems make it a novel pot variety.

and more beautiful flower than Wilson's White. Compact, short, rigid growth and vigorous breaking action. Flowers develop most rapidly when finished 60° or less.

IN THE FOLLOWING LIST NEW VARIETIES FOR 1960 ARE ENCLOSED IN A BOX.

Normal Flowering Date

XYELLOW CRYSTAL New

P-1 Nov. 5

Medium lemon yellow spider. An excellent sport of the increasingly popular pot variety Snow Crystal. Strong habit and tall treatment is re-quired the year round. Both disbud and spray pots are being grown.

YELLOW CALYPSO

Nov. 8 **S-1**

Large lemon yellow incurve.

YELLOW DELAWARE

5-9 Nov. 8

Large golden yellow incurved sport from Delaware. Close attention to having plants fully established and pinching into soft new wood is important for maximum breaking action.

S-1

YELLOW PRINCESS ANNE—New Nov. 10

Large decorative standard. Sulfur yellow. A very responsive, uniform and efficient pot variety. Color will not tolerate extreme summer heat. Mid September through mid June flowerings yield best

GOLDEN CALYPSO

Nov. 10

Large incurve. Golden yellow sport from Yellow Calypso.

SCEPTER

Nov. 10

Large decorative. Deep golden yellow. Will tinge golden bronze with low temperature finish.

BONNAFFON DELUXE

Nov. 20

Intermediate deep lemon incurve. A rewarding and top notch pot variety. Sensitive to heavy soils and overwatering. Requires a 65° minimum temperature for growth, initiation and early stages of YELLOW VALENTINE—New

Nov. 20

P-1

Brilliant golden yellow sport of Valentine. For October through April, with tall treatment, this variety should be competitive with Yellow Delaware. Do not finish lower than 60°. Available June 6, 1960.

BRONZE AND RED

WEEK

BRONZE CALYPSO

bud development.

Normal Flowering Date

COSSACK

P-1 Nov. 5

Large decorative standard. Intense crimson red. Limited to single stem pot programs.

Small formal standard. Light bronze. Pinched crops require high light conditions.

P-1 Nov. 5

Large decorative. Red to reddish bronze. A profuse and wide-angled breaking habit contributes to a shapely plant. One of the very best for a bronze in summer pot programs.

Nov. 5 P-1 Large decorative. Crimson red. A close companion to Red Star.

DELAWARE Nov. 8 Large reddish bronze semi-incurved standard.

Outstanding for pot plants pinched and single stem. Its dwarf habit and slow rate of growth make attention to soft tip pinching into only new growth of fully established plants of primary importance.

INCURVED DELAWARE Nov. 8

Large standard. Reddish bronze. Shows gold reverse due to incurved form. Tightly incurved form mutation from Delaware.

Variety-Description

CLIPPER—New Nov. 10

Large incurved bronze red with light bronze reverse. A huge, beautifully incurved version of Delaware but twice as large. Strictly for pots October through April. Needs medium treatment. Available June 6, 1960.

BRONZE DELUXE—New Nov. 10

Light bronze sport of Pink Deluxe. Large decorative. Requires cool finish. Available June 6, 1960.

WOKING SCARLET

Large decorative standard. Brilliant scarlet bronze. An exciting combination of color and habit for pots. Vigorous and requires close attention to shade and delayed pinch procedure.

RED HUMDINGER Nov. 11 S-4

An exciting burgundy red sport from Humdinger. Form, size and vigor are identical to the parent variety. Requires attention to soft tip pinching of fully established plants.

#2 RED HUMDINGER—New Nov. 11 A significant color intensification on Red Humdinger. This one has more red and less purple.

HARMONY-New Nov. 15

Medium sized semi-incurved standard for pots. Brilliant golden bronze. Uniform and responsive for flowering mid-September through June. Delays with heat. Available June 6, 1960.

TAN VEDOVA-New

Nov. 15

Light bronze sport of Vedova. A new pastel color that requires a cool 60° finish. October through April pots with tall treatment. Available June 6,

PINK

WEEK

PINK RIBBON—New

Nov.

Light lavender pink incurved standard. A distinctive color and form sport from Blue Ribbon. Since this requires a cool 60° finish for best color, flower March through mid-May, and October through December in pot programs, medium treatment. Available June 6, 1960.

BLUE RIBBON—New

Small bright lavender pink incurve. Color markedly improves Queen of Pinks. Valuable for summer color retention.

SANDROCK

CLIPPER

VARIETIES FOR YEAR-ROUND POTS

PINK

Growers Agreement

WEEK

Variety—Description

DARK RIBBON—New

Normal Flowering Date

Nov. 1

Small incurved deep pink sport of Blue Ribbon. Flower is more solid, formal and holds its form in all periods. Better color for hot weather. For flowering March through December, for pots. Available June 6, 1960.

Nov. 1 **S-4** QUEEN OF PINKS

Small pink incurve. An old favorite for pots. Requires cool finish.

Flowering Date Variety—Description

Nov. 1 BRIDESMAID

Large spider. Light lavender pink for pots. Medium growth habit combined with good breaking action, spread and uniform response make for a superior pink spider. Stronger necks than the Lace varieties.

(A) GLAMOUR Nov. 1 Formal pom of intermediate size. Lavender pink.

MERMAID

Nov. 5

Intermediate pompon. Medium lavender pink with an intense tone on tone center contrast. High summer temperature color retention equals that of Blue Ribbon.

LOUBENS Nov. 5 P-1

Large incurved standard. Deep lavender pink. Best pink for single stem pot programs.

S-6 CRITERION Nov. 8

Large pink decorative with a vigorous growth habit. Achieves a peak of perfection in the fall, winter and spring.

ROSAMUND—New Nov. 10

Medium sized semi-incurved standard. Rose pink with coral overtones. Prolific and responsive, it is good in Spring and Winter crops. Habit resembles Woking Scarlet. For pots, needs tall treatment. Available June 6, 1960.

PERSONALITY Nov. 10

A large luminous-pink incurved pompon. Tolerant of 56° for bud initiation and development.

Nov. 10 HUMDINGER

Large luminous violet purple, formal pompon. Tolerates 56°. Strong consumer appeal. Best breaking action is obtained from soft tip pinches of vigorously growing plants.

P-1 Nov. 10 FROLIC

Intermediate pompon. Bright lavender pink. Breaks, spreads and responds in a foolproof manner. Spray pot programs.

PINK DELUXE Nov. 10

Medium to large lavender pink disbud. Heavy stems, short internodes, with free and wide-angled breaking action. Slowed and frequently burned by high temperature. Requires prompt disbudding also.

PRINCESS ANNE—New Nov. 10

Large decorative standard. Salmon pink. Valuable new color and form addition to the mid September through mid May program. Pinched pots spread and break well with excellent uniformity and response.

P-1 Nov. 15

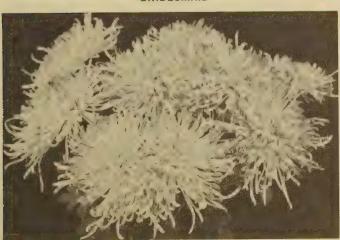

Intermediate anemone. Bright pink. Short habit.

A HEATHER—New

Nov. 15 P-1

Medium sized luminous pink anemone for pots. Breaks and spreads well for mid September through May programs. Available June 6, 1960.

Variety—Description Rormal Flowering Date Price

WHITE PINK CHIEF Oct. 15 S-5 Intermediate pure white incurve. Selection from Pink Chief. Tolerates 56°. Will develop pink tinges with cool (60°) finishing temperatures. Tall growth habit. Best given 9-week long day treatment. Resists heat delay and petal burn.

Variety—Description Flowering Date Price
SILVER SHEFN Oct. 20 S-3

SILVER SHEEN Oct. 20
Intermediate white incurve. Tolerates 56°.

#2 WHITE CHIEF Oct. 20 S-1
White incurved standard. Short habit. This variety is quite dissimilar and has no known relationship to White Pink Chief.

WEEK

JULY 25

SILVER QUEEN Oct. 25 S-1
White Fuji mum. Stem improves Rayonnante.

MARBLEHEAD Oct. 25 S-2 Medium clear white incurve. Durable and responsive.

AMBASSADOR Oct. 25 S-2
Large ivory incurve.

MOONTIDE Oct. 28 P
Medium to small ivory-white standard. Tightly incurved ball form. Withstands minimum of 56° in the spring for bud initiation.

in the spring for bud initiation.

QUEEN'S LACE

Large white spider. Tolerates 56°. Responds well

in both lighted and shaded programs.

ALBATROSS

Nov. 1

Set Large white incurve, Tolerates 56°. Rated as one

Large white incurve, Tolerates 56°. Rated as one of the better West Coast varieties used for spring and summer flowering. Ships well.

DONLOPE'S WHITE SPIDER—New Nov. 1 P Large spider. Ivory white. Unequaled for size and form. It provides a fine companion for the popular Luyona. Strong stem, good foliage and tolerance of high temperature are valuable assets. Its vigor and size rank it as the top white spider available.

WHITE MARY GARDEN Nov. 1 S-1
White sport from Mary Garden. Straight tubed spider. Tinges pink at low temperatures.

THEMESONG

Medium semi-incurved ivory white standard. Possesses Good News substance and durability, but smaller in size. Adapted especially for summer high

light, high temperature periods and intolerant of less than 60° for initiation. Very resistant to petal burn.

10 WEEK

AUGUST 1

INDIANAPOLIS WHITE Nov. 5 S-8
Large white incurve. Flowers are sensitive to heat
burn, Not considered tolerant to outdoor culture.

IMP. IND. WHITE

Large white standard. Selected for, and provides a very significant reduction of winter quilling in comparison with the original parent variety. During the winter, depth of flower is greater and incurvature improved. Slight ivory overcast until full maturity. The best of the Indianapolis White selections for flowering in less than 60° finishing units. Devoid of pink tinges. Not as tolerant to warm 60° in winter as Indianapolis White or #3 Indianapolis White.

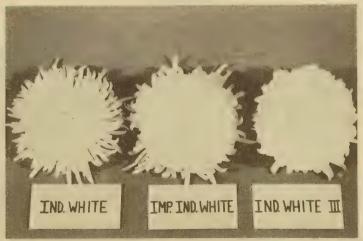

GIANT BETSY ROSS Nov. 5 S-7

Large white incurved sport of Betsy Ross. Requires high temperatures for initiation and development.

#3 INDIANAPOLIS WHITE Nov. 5 P-1
Large incurve. White. Sport from Indianapolis
White. Like the Imp. Ind. White it does not quill
under winter low light and temperature conditions.
Noticeably larger than the Improved, a whiter
color, and superior in form retention and depth of
flower. It is, by all measurements, the best selection to date from Indianapolis White for use at any
period when the Indianapolis varieties are grown.

DONLOPE'S WHITE SPIDER

WHITE

10 Week

PINCH AUGUST 1 Variety-Description

WHITE RAYONNANTE

Normal Flowering Date Pr

wering Date Pric

Nov. 5 S-3

White spider. Straight tube. Best adapted to West Coast environments,

WHIRLWIND Nov. 5 P

Large pure white reflexed standard. Supplement for Betsy Ross in the summer. Durable with strong growth and heavy petallage. Shaggy, interesting new form.

WHITE PRINCE—New

Nov. 5 P-1

Intermediate pure white incurve from J. W. Prince. Durable, short, and withstands heat and humidity well. Available June 6, 1960.

SUSAN LEIGHTON

Nov. 6 F

Large ivory white spider. Thin delicately tubed petals. Short habit.

THE FAVOURITE New Nov. 10 P-1

Large incurved standard. White. Same family as Golden Favourite. Responsive and durable. Cut crops require an extra long day week. Its impressive tolerance to both high and low temperatures merits full consideration for West Coast standards.

JEAN ELIZABETH

Nov. 10 P

Large white semi-incurve. A Queen Sport.

Variety—Description

Normal Flowering Date

owering Date

CRYSTAL QUEEN

Nov. 10

A pure white sport from Orchid Queen that improves Jean Elizabeth in clarity of color and compactness of flowers. The Queens prove to be more reliable in Single Stem programs rather than pinched. They lack uniform breaking action. Better heat tolerance allows the Queens to be flowered later into the spring than the Indianapolis varieties.

MEFO Nov. 10 S-7

Large ivory incurve. Considered by many producers to be one of the best all around white standards for winter production in the northern states. It achieves larger flowers and more vigorous growth during the mid winter months than do the Indianapolis Whites.

MONUMENT

Nov. 10 S-2

Intermediate ivory incurve.

FRED SHOESMITH

Nov. 12 S-6

Large white incurve. A very late 10-week or early 11-week variety. Relatively short, stocky growth that should receive 10-week treatment to obtain desired stem length. Tolerates 56°. Excels the size of Indianapolis White, and usually flowers about 7 days later in either a lighted or shaded program. Cool finish in winter materially benefits stem strength. It does not display winter quill nor pink in any manner. Requires protection and is slow under high temperature conditions. Warm finishes induce shattering. Best grown pinched to offset tip split.

Oct. 25 Intermediate light lemon yellow incurve.

PINCH JULY 25 LUYONA Oct. 25

Large yellow spider with quality blooms and fine stem. Tolerates 56°. Prolific and dependable bantamum. Its unquestioned reliability has made it the most popular yellow spider grown for year round use. Form is best if flower is cut slightly green.

SUNGLOW Oct. 25 Large golden yellow incurve.

YELLOW MARBLEHEAD Oct. 25

Medium lemon-yellow incurve. Sport of Marblehead. The Marbleheads require the high light, high temperature combination to achieve maximum stretch and flower size.

MECCA Oct. 25 P-1

Large incurved standard. Deep lemon yellow. Tall, vigorous growth habit. Should not be crowded. Withstands burning.

YELLOW LACE Nov. 1 **S-2**

Lemon yellow spider.

Variety—Description Flowering Date

GOLD LACE Nov. 1

Golden yellow spider. Sport of Yellow Lace. Tolerates 56°. Versatile variety that lends itself to both lighted and shaded programs.

GOOD NEWS Nov. 1

Large deep yellow incurve. Tolerates 56° for bud initiation but grows and develops the largest flowers under high light, high summer temperatures. Flowers are durable. Adapts to either greenhouse or cloth house culture. One of the better shippers.

YELLOW IVANHOE Nov. 1 **S-1**

Golden vellow sport from Ivanhoe. Tolerates 56°.

Nov. 1

Large incurve. Lemon-yellow sport of Albatross. Used in West Coast standard programs.

GOLDEN BOY New Nov.

Deep lemon yellow incurved standard. Stems are quite heavy and rigid. Flower develops great depth and retains its incurvature well. Very resistant to high temperature burn, and therefore recom-mended May through mid November. It is larger than Good News, a little softer but ships well. Fall crops are best grown pinched for uniform terminal bud development.

PINCH **AUGUST 1**

IMP. IND. YELLOW

Nov. 5

Light golden yellow selection of Indianapolis Yellow. Displays best form for yellow Indianapolis varieties in winter crops. The most versatile and popular of the Indianapolis yellow varieties.

INDIANAPOLIS YELLOW

Large lemon yellow incurve. Clear yellow color. Less orange cast than Imp. Ind. Yellow.

INDIANAPOLIS GOLD

Nov. 5 **S-7**

Large golden yellow incurved standard. Color intensifies the present Dk. Ind. Yellow. Same habits. Petals quill during the winter.

DK. IND. YELLOW Nov. 5 **S-4**

Deep lemon yellow. Develops one of the largest sized blooms within the Indianapolis group during the high light periods of spring and fall. Form reverts to all tubular petals when flowered during low light periods of mid-winter.

Normal Variety-Description Flowering Date Price

YELLOW PRINCE—New Nov. 5 Intermediate yellow incurved sport of J. W. Prince.

Very durable. Tolerates heat and humidity well. Available June 6, 1960.

CHAIRMAN Nov. 5

Large golden yellow decorative. Tolerant to 56° for bud initiation. Vigorous. Form distorted by high summer greenhouse temperatures.

YELLOW BETSY ROSS Nov. 5

Intermediate lemon yellow incurve. Sport of Betsy Ross. Shorter habit, smaller more tightly incurved flower. Strictly for high temperature flowering periods.

IMP. YELLOW RAYONNANTE Nov. 5

A clear yellow spider selection of Yellow Rayonnante with increased size and improved form. Vigor and stem strength are also greater. West Coast variety.

EXPLORER Nov. 5

Large incurved standard. Deep yellow. Tall growth habit. A Good News seedling with all its low temperature tolerance, improved vigor and uniformity. A faithful performer from late September through early June in non-cooled greenhouses in Ohio. Excessively high temperature finishes cause some flower malformation, but superb with cool finish. Petallage has substance and is resistant to burning.

INDIANAPOLIS CREAM Nov. 5

Large incurve. Cream yellow. Taller and more vigorous than Indianapolis Yellow and a few days slower response.

NIGHTINGALE

Chartreuse green spider. Popular West Coast novelty.

YELLOW LEIGHTON Large delicate spider. Lemon yellow. Short habit. Variety-Description

Deep lemon yellow sport from Tiptop. Identical with the parent variety in all respects except color. Will be a valuable supplement to the Whitetop varieties.

YELLOWTOP Nov. 5 S-4

Lemon yellow sport from Whitetop. Used extensively in cloth house and greenhouse. Benefits from partial disspray in summer.

GOLDTOP Nov. 5 P-1

Intermediate pompon. Deep lemon yellow. A color improvement over Yellowtop. Flower has a pronounced green eye and is more ball shaped than Yellowtop.

AZTEC Nov. 5 P
Intermediate deep yellow daisy. Tolerant of 56°.

MARY HALL Nov. 5 S-2
Intermediate deep lemon pompon. Tolerates high

Intermediate deep lemon pompon. Tolerates high temperatures well. Tolerates 56°.

CRESCENDO Nov. 5 S-4
Large yellow pompon. Well known variety for high temperature periods. Tall. Tinges bronze with low temperature finishes.

CONSTELLATION Nov. 5 P

Intermediate decorative. Brilliant yellow. Given one additional long day week, it is unsurpassed in natural season.

YELLOW BEAUREGARD Nov. 5 S-5

Intermediate pompon. Clear golden yellow at all temperatures. Selection from Orange Beauregard and identical habit. Temperature tolerance of parent variety. Especially valuable in summer greenhouse and cloth house programs. Tolerates 56°. Sprays are clubby if flowered much earlier than May.

Variety—Description

Normal Flowering Date Price

YELLOW ICEBERG Nov. 5 S-7

Clear lemon yellow sport from Iceberg. Closely identical to parent variety. Valuable for high temperature periods. Spray programs are always benefited by early center bud removal. Fine cloth house variety. Intolerant of less than 60° for bud initiation.

#2 YELLOW ICEBERG—New Nov. 5 P-1

Deep yellow sport from Yellow Iceberg. As well as intensified color this sport displays a small improvement in size and form over the original Yellow Iceberg. It should eventually replace the original Yellow Iceberg and become recognized as the best in its class.

GOLDBERG Nov. 5 P-1

Large pompon. Golden yellow sport from Yellow Iceberg. Color intensification over Yellow Iceberg. Flower is harder, more double and slightly smaller. Improved bench keeping qualities with smarter winter flower form.

SUNFIRE Nov. 5 S-

Medium to large single. Dark yellow. Wide petals are tubed at their base. Retains its green-eyed disc. Well-balanced terminal sprays with rigid stemmed growth.

GOLDEN BANTAM Nov. 5 P-1

Small pompon. Deep golden yellow. Its heavy production without sticking at high temperature; its superb form retention coupled with intense color and durability rank it without peer among small yellow poms.

LUXURY Nov. 8 S-2

Large decorative. Clear yellow in the summer. Bronze overtones in spring and fall.

CREAM SHASTA Nov. 10 S-1

Beautiful cream yellow color. Tolerates 56°. Most vigorous of the Shastas.

YELLOW SHASTA S-7 Nov. 10

Large light lemon yellow anemone. Tolerates 56°. Like its parent 60° environment allows for best cushion development. High summer temperatures will delay flower development.

> P-1 Nov 10

Large deep yellow anemone. Intensifies color of Yellow Shasta. Less quilling of ray petals, Same vigor. There are two Golden Shasta varieties, This one is the best.

JEALOUSY Nov. 10

Small pompon. Intense yellow, bright green eye. Hard, ball type. Will develop green bracts under extreme heat.

YELLOW IGLOO Nov. 10

Intermediate deep lemon yellow pompon. Selection from Illini Igloo. Same habit and temperature tolerance. Tolerates 56°.

Variety—Description

HEYDAY Nov. 10

Intermediate bright yellow pompon. Will initiate and develop its buds well at 56°. Characterized by open terminal sprays at any time of the year. Very high summer greenhouse temperatures will cripple form. More reliable than Yellow Iceberg for early spring flowering where 60° minimums cannot be maintained.

S-1 YELLOW PACESETTER Nov. 10 Lemon yellow single. Short habit.

YELLOW ILL. SNOWDRIFT **S-3** Nov. 12

Small novelty decorative. Yellow. Slightly less vigorous during marginal light periods.

Nov. 14

Golden vellow intermediate anemone for natural spray poms. For same period that Crescendo is flowered. Finishing temperature less than 60° induces bronze tinges. Vigorous habit. Can use one less long day week.

PINCH **AUGUST 8**

SOUVENIR

Nov. 15

Intermediate dark yellow daisy with an early 11-week response. Has all the traits to give it a "Superior" rating for shaded or lighted crops.

YELLOW SCULPTURE Nov. 15 Lemon yellow daisy. Sport of Sculpture.

PRINCETON Nov. 15

Intermediate golden decorative.

GOLDEN CHORD Nov. 15

Intermediate pompon. Intense golden yellow. Requires 60° for initiation. A superlative late cloth house as well as greenhouse variety.

FORTY-NINER Nov. 15

Intermediate brilliant golden yellow pompon. Requires 60° for initiation and high light intensity for maximum production. Popularized for fall and winter flowering in Florida cloth houses where form and color has no equal.

ESQUIRE

S-3 Nov. 15

Intermediate deep yellow decorative. Strong, trim habit. Tolerates 56°. Dependable within a wide range of temperatures.

GOLD BALL Nov. 15 **S-4**

Intermediate golden yellow pompon. Size of Corsair. Temperature tolerance improves Golden Chord and Forty Niner.

SUSANNE MILLER

Nov. 15

Large anemone. Deep yellow cushion. Norma sport. Tolerates 56°.

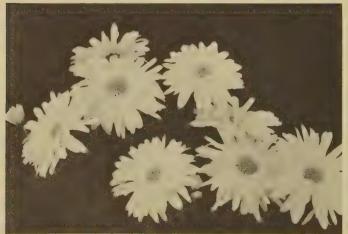

YELLOW TAFFETA

NEW GARDEN VARIETIES FOR 1960

* Useful as a Garden Pot Plant

WHITE

NANOOK

Sept. 14

Small decorative cushion. A dwarf mound smothered by cream colored flowers. A delightful border plant

ALBAFLORA

Sept. 20

Large silvery white decorative with slightly cream center. Prolific flowering habit. A very attractive plant.

RAGGEDY ANN

Sept. 28

Beautiful large white cushion, novelty. Carnation type petals. Vigorous growing variety with loads of flowers. For those who want something different.

MOUNT HOOD

Sept. 28

Pure white large incurved decorative. Prolific flowering habit. Sturdy stems that support mounds of flowers.

CANDLEGLOW

Sept. 28

Tall clear crisp creamy white decorative. Excellent for table bouquets.

*CORSAGE CUSHION

Oct. 1

Compact and clean growing carnation type cushion. Buds show tinges of pink, but open a beautiful white. Compact and prolific flowering habit. Outstanding as a spring pot plant for 3" or larger pot sizes. You will welcome this variety.

HENRY ETTS

Oct. 1

Tall and vigorous growing pure white spoon. Stiff stems and strong pedicels. A decided improvement over the present white Spoon. A really worthwhile addition.

YELLOW

JOHN MILBRATH

Sept. 10

New 3" glistening bright yellow decorative. Slightly incurved. Nice for table use or border plantings.

EXETER

Sept. 25

Medium golden formal decorative. Compact growth habit with well placed flowers. Contrasting deep green foliage with a brilliant display of flowers when fully open.

BETH RUSSEL

Oct. 1

Large cream decorative. Strong sturdy stems support a wealth of blooms. Compact growing habit. A beautiful specimen plant.

RED AND BRONZE

DANDY (H)

Sept. 16

ABUNDANCE

Sept. 20

Early blooming incurved reddish bronze. Upright cushion plant. Blooms for two months.

Medium golden bronze decorative. Early and compact, displaying an abundance of blooms. Will attract much attention.

NEW GARDEN VARIETIES FOR 1960

* Useful as a Garden Pot Plant

RED AND BRONZE (Continued)

*LAWRENCE BLANEY

Sept. 25

NOBILITY

Oct. 4

Beautiful glittering orange red decorative. Compact and smartly styled. Mounds of blooms. Excels as a spring pot for 3" or larger. A real value.

Velvety textured deep red decorative with rich green foliage. Long stems for cutting.

MIKADO Sept. 25

Large cactus type decorative. Beautiful red 4" flowers that respond to disbudding. Heavy 2½ ft. producer in

late September. A real eye catcher.

NINA REBMAN

Oct. 10

Bright non-fading rich dark red. Flowers have excellent substance and are frost resistant. Heavy producers of exquisite sprays for table bouquets.

PINK

PRINCESS (H)

Sent 15

Peach to rose pink decorative with gold pink petals borne on 15" to 18" plants which begin to flower in early September. A delightful mound of continual fresh looking blossoms.

JOSEPHINE FERRIS

Oct. 5

Cream pink pompon with contrasting deep pink centers. Pale lavender buds swell into enhancing fine textured flowers. Has a good growth habit with outstanding production.

MINNEHAHA

Sept. 20

Lovely 2" blossoms of rosy sandalwood pink on a large cushion type plant.

TREVANIA

Oct. 10

Large coral peach 3" decorative. Lush green foliage on stems perfect for table use.

*PINK SPOON CUSHION

Sept. 26

Vigorous growing lavender pink spoon. Much more prolific flowering than the other Spoons. An excellent late Spring pot plant. Best for Memorial Day.

BETTY ETTS

Oct. 10

Bright orchid pink spoon of outstanding texture. Long tubular petals with spoon tips. Heavy stemmed and wind resistant. A delightful garden plant for table bouquets or ornamental use.

*PURPLE DUSK

Sept. 26

Upright cushion of light purple. Compact and clean growing. Another valuable spring pot addition for 3" pots or larger.

EVELYN GARREN

UCT. 1

Striking large rose and gold incurved. Compact growth habit making a lovely garden specimen. A variety that is really wind and frost resistant. It is enhanced by partial disbudding but is not necessary.

*ANN LADYGO

Oct.

Medium pink anemone. Cushion type growth. One of the loveliest garden specimens to date. When in full flower the foliage is completely covered by beautiful pink anemones. The most exciting new spring pot available.

GARDEN VARIETY COLLECTIONS

COLLECTION PRICES PER 100

300 - 450	500 - 950	1000 Up
6.25	6.00	5.75

For growers who are not familiar with Garden Varieties, but who wish a well balanced assortment, we offer the following collections which include the better varieties for each specific purpose.

COLLECTION #1

Taller varieties for cut flowers.

COLLECTION #2

Varieties for bedding or borders.

COLLECTION #3

50% for Cut Flowers. 50% for Bedding or Borders.

COLLECTION #4

Varieties suitable for Easter, Mother's Day or Memorial Day pots.

COLLECTION #5

Cushion varieties only.

GRASSELI SPREADER STICKER1 gal. 9.00	VAPATONE XX1-gal. can	12.50

We can supply you with any insecticide or fungicide not listed above. Prices subject to change without notice.

JIFFY POTS

These are now extensively used to hasten programs and smooth out tight situations where a crop may be delayed. The cuttings can be started in a 3" square jiffy preferably and can be pinched in the pot. We caution you to try and bench before the 5th week, as crop may suffer otherwise. Packed 1000 per ctn.

1000 - 9000	\$14.50 per 1000
10,000 - 49,000	13.25 " "
50,000 up	12.00 " "

5 cartons up sent prepaid

BLACK SHADING CLOTH

Black Sheen cloth guaranteed to reduce the light intensity to 2 foot candles or less when shading your early chrysan-themums.

#575—Quality cloth sewn in multiple of 18-inch widths to your specifications.

#258—Extra heavy cloth for longer service sewn in multiples of 18-inch widths to your specifications.

Gloeckner's Sheen—A good quality cloth strongly sewn. Competitively priced. 36" widths only.

Knight's Black Sheen—Extra heavy cloth in 18" widths to your specifications.

American Black Sheen—Good quality for inside or outside.

Cloth is approximately 36 inches wide unsewn in rolls or sewn to your dimensions in multiples of 18 inches. There is a loss of about 2 inches per yard in width because of shrinkage in preparation and overlapping in sewing. So allow for this in estimating the width of the cloth you need. Here is a chart to help you estmate the width and length of the cloth required to cover different sized benches or beds with wire placed 4 feet above the bench:

For a bench of this width	Use cloth of this width	And add to length for end hangover	
3 feet	12 feet	9 feet	
3½	12	8½	
4	131/2	9½	
41/2	131/2	9	
5	15	10	

WHEN ORDERING...SPECIFY THE TYPE YOU WANT!

Prices available upon request.

THIS IS YOUR 1960 Gloeckner CHRYSANTHEMUM CUTTING ORDER BLANK
